## PREFACE.

The Canada Year Book had its beginning in the first year of the Dominion when the semi-official "Year Book and Almanac of British North America"—being (to quote its sub-title) "an Annual Register of political, vital, and trade statistics, customs tariffs, excise and stamp duties, and all public events of interest in Upper and Lower Canada, New Brunswick, Nova Scotia, Prince Edward Island, Newfoundland, and West Indies"—was founded.

Subsequently the Year Book experienced many metamorphoses under the able editorship of such men as Dr. George Johnson and Dr. Archibald Blue, whose names are outstanding in the field of early statistical work in the Dominion, and, after the reorganization of statistics that followed the report of the Royal Commission on Statistics of 1912 and the establishment of the Dominion Bureau of Statistics in 1918, by E. H. Godfrey, and by S. A. Cudmore now Assistant Dominion Statistician.

The editorial task of keeping the contents of each edition of the Year Book within convenient limits is becoming more difficult each year. It is no longer possible to cover the entire field of information in a single edition. The plan adopted, therefore, has been to save space by making reference in the text and in the classified list at pp. vii-x to special articles and significant historical or descriptive matter in earlier editions that have not been subject to wide change and are therefore not repeated. To this extent the Year Book must now be regarded as a series of publications rather than as a single volume.

This edition of the Year Book gives a picture of Canada once again at war and in this instance engaged in a conflict that threatens to tax the Dominion's strength, financial and economic, to the utmost. The period covered by the 1940 Year Book spans ten months of war effort and the effects of the vast changes incidental to that effort are shown in several directions. In the Introduction a co-ordinated résumé of all that has been accomplished is presented, followed by a review of economic conditions; these throw into clear perspective the changes in Canada's economy that the War has been instrumental in provoking. In Chapter IX—Forestry—there appears at pp. 251-258 an article on Canadian Forest Resources: Their Relation to the War of 1914-18 and to the Present Effort; and at pp. 298-309, Chapter XII—Mines and Minerals—a special treatment entitled The Development of Canada's Mineral Resources in Relation to the Present War Effort is given. These features, along with the Special War Chronology at pp. 36-40 (carried down to July 8, 1940, in Appendix I) and in conjunction with the revisions of the general chapter material, reflect the economic and other adjustments that are now under way. All parts of the volume have been carefully revised: the latest information appearing to the date when each section was sent to press is included.

The following are among the more important additional new features incorporated in the present edition: Chapter XIII, formerly devoted to a treatment of water-power development, has been recast and broadened to cover all power, however generated, and its utilization. This has involved careful study and co-ordination of material from other chapters of the Year Book as well as from outside sources, more especially in relation to power equipment. The result is more in line with the purpose of the Year Book, viz., to bring together all related information from official sources in a way most convenient and accessible to the reader. The chapter is introduced by a special article on Water-Power Resources, more comprehensive than any on this subject that has appeared heretofore in the Year Book. Considerable editing and rearrangement has been undertaken in Chapter VIII—Agriculture—where special features appear on: Agricultural Marketing Legislation

at pp. 181-185, a review of Provincial Agricultural Colleges and Schools at pp. 190-198, and a treatment of Special Types of Farming in the Prairie Provinces at pp. 230-234. In Chapter XVIII—Transportation and Communications—several of the *lacunæ* that formerly could not be bridged have been more completely linked up and a special section on the National Harbours Board is presented at pp. 679-682. In Chapter XIX—Labour and Wages—the more logical arrangement now followed will, it is hoped, be found helpful by the reader.

The Currency and Banking Chapter contains at pp. 888-892 a pertinent article on the Royal Canadian Mint, and the insurance field—Chapter XXIII—is broadened in scope by a summary treatment of Insurance as it Affects the Balance of International Payments. The chapter on Education—Chapter XXV—has been supplemented by a special article on the Background of Scientific and Industrial Research in Canada. In former editions, research has been dealt with under the subject headings of each chapter: the result has been that a complete picture of research effort was impossible. Moreover, effort in the research field is so interlocked and interrelated that it can no longer be dealt with satisfactorily in such a piecemeal fashion. It is felt to be more useful to introduce a complete article, along the lines of that which now appears at pp. 979-1012, at intervals of about five years, than to continue the former disjointed method of treatment.

Since Chapter III—Constitution and Government—went to press, information on votes polled, etc., at the Dominion General Election of Mar. 26, 1940, has been issued by the Chief Electoral Officer; this is published in tabular form as Appendix III. On July 8, 1940, the Prime Minister, the Rt. Hon. W. L. Mackenzie King, gave details to the House of Commons regarding the reorganization of the Dominion Cabinet. The constitution as at that time is shown in Appendix VII. The Report of the Royal Commission on Dominion-Provincial Relations (the Rowell-Sirois Report) was tabled in the House of Commons on May 16. The recommendations made therein are far-reaching and are charged with significance for all Canadians. A summary of the principal recommendations is given in Appendix V and certain summary financial statistics of all governments in Canada in Appendix VI.

In many other respects changes have been introduced with the object of making the Year Book more useful both as a general reference work and as a compendium of information on the institutions and social and economic conditions of Canada.

The present volume has been edited by A. E. Millward, Editor of the Canada Year Book. Charts, graphs, and layouts, except as otherwise credited, have been made by, or under the supervision of, J. W. Delisle, Senior Draughtsman of the Dominion Bureau of Statistics.

Grateful acknowledgements are hereby tendered to the numerous officials of the Dominion and Provincial Governments, and to other individuals who have assisted in the collection of information. Credit is apportioned to the various persons and services concerned by means of footnotes to those chapters and sections that have been contributed, or in the compilation of which co-operation has been received.

While every care has been taken in preparation, there are doubtless imperfections and, with a view to the improvement of future editions, the Bureau will be glad to hear of any errors that may have escaped notice, and to receive suggestions with regard to omissions or to methods of treatment.

R. H. COATS,

DOMINION BUREAU OF STATISTICS,  
OTTAWA, July 15, 1940.

Dominion Statistician.

# ARTICLES AND MISCELLANEOUS TEXT MATERIAL (PUBLISHED IN FORMER EDITIONS) CLASSIFIED BY SUBJECT.

NOTE.—As explained in the Preface, it is not possible to include in a single edition of the Year Book all articles and descriptive text of previous editions, and the following list has been compiled as an index or key to miscellaneous material and special articles, contributed by authorities in their particular fields, that appear in earlier editions. This list links up the 1940 Year Book with its predecessors in respect to matters that have not been subject to wide change. Those sections of chapters, such as Population, which are automatically revived when new material is made available from a later census, and to which adequate references are made in the text, are not listed unless they are in the nature of special contributions. Only the latest published article on each subject is shown except when an earlier article takes in ground not covered in the later one. When articles cover more than one subject they are listed under each heading.

**THE  
STATISTICAL SUMMARY  
OF THE  
PROGRESS OF CANADA  
1871-1939.**

NOTE.—In the following Summary, the statistics of fisheries (1871-1916), trade, shipping, the Post Office, the public debt, revenue and expenditure, and the Post Office and Government savings banks relate to the fiscal years ended June 30 up to 1906; subsequently to years ended Mar. 31. Agricultural, dairying, fisheries (from 1922), mineral, manufacturing, banking, insurance, loan and trust companies, construction, road transportation, vital, hospital, and immigration statistics relate to the calendar years, and railway statistics to the years ended June 30, 1871-1916, and to the calendar years 1921 and 1926-39. Canal statistics are those of the navigation seasons. The telegraph statistics relate to the fiscal years for Government lines and to the calendar years for other lines.

# STATISTICAL SUMMARY OF THE PROGRESS OF CANADA.

Area of the Dominion of Canada in square miles: Land, 3,466,556; Fresh Water, 228,307; Total, 3,694,863.

NOTE.—Dashes in this table indicate that comparable data are not available for the years so indicated.

<sup>1</sup> Estimates of population since the 1931 Census are subject to adjustment as later data are made available.

<sup>2</sup> Figures for 1939 are subject to revision.

<sup>3</sup> Estimated populations are given for

intercensal and post-censal years.

<sup>4</sup> Revised in accordance with the Labrador Award of the Privy

Council, Mar. 1, 1927.

<sup>5</sup> Includes Canadian Navy.

<sup>6</sup> Exclusive of the Territories.

<sup>7</sup> For these causes of death the comparability between the figures for the year 1926 and those for later years

# STATISTICAL SUMMARY OF THE PROGRESS OF CANADA—continued.

The length of the Canada-United States boundary is 3,986.8 miles, and that of the Canada-Alaska boundary is 1,539.8 miles.

NOTE.—Dashes in this table indicate that comparable data are not available for the years so indicated.

<sup>1</sup> Figures for 1939 are subject to revision.<sup>2</sup> Figures for the decennial census years 1881-1921 are for the next preceding years. In the Censuses of 1881 and 1891 values only were given of factory butter and cheese; quantities have been calculated by reckoning cheese at 10 cents per lb. and butter at 25

<sup>1</sup> Figures for 1939 are subject to revision.<sup>2</sup> In thousands.

<sup>3</sup> The statistics of manufactures in 1871 and 1881 include works employing fewer than 5 hands; those of 1891, 1901, 1911, and 1916 are for works employing only 5 hands or over except in the case of butter and cheese factories, flour and grist mills, electric light plants, lumber, lath and shingle mills, lime kilns, brick and tile works, and fish canneries. The figures shown are for the preceding years in each case. From 1922 statistics are exclusive of construction, hand trades, repair and custom work. Figures for 1926-38 include non-ferrous metal smelting not included in earlier years.

<sup>4</sup> Includes all establishments irrespective of the number of employees.

provincial companies, but estimated to cover about 90 p.c. of all provincial business. The figures include all the large and most of the small provincial companies.

<sup>9</sup> Revised since the publication of the 1939 Year Book.

<sup>7</sup> Not including fraternal insurance.

<sup>8</sup> Figures are for 1924, the first year for which bank debits are available.

<sup>9</sup> Includes Newfoundland.

<sup>10</sup> Year ended Sept. 30.

<sup>11</sup> 1886 figures; first year available.

<sup>12</sup> During the respective fiscal years.

## INTRODUCTION.

### Canada's War Effort and Economic Conditions at the End of June, 1940.

On Sept. 1, when the German army invaded Poland and a general war seemed inevitable, the Prime Minister of Canada announced that Parliament was being summoned to meet in Emergency Session on Sept. 7 and that, if the United Kingdom became involved in war, the Government would seek authority from Parliament for effective co-operation by the side of the United Kingdom. On Sept. 3, as soon as it was learned that the United Kingdom and Germany were at war, the Prime Minister, in a broadcast to the people of Canada, outlined the steps that had already been taken by the Government to meet the emergency. By the War Measures Act of 1914, all necessary power is given to the Government to meet such circumstances as the outbreak of hostilities had precipitated. This legislation enabled the Government to act quickly; as soon as there was valid reason for apprehending the outbreak of hostilities, steps were taken to ensure the proper defence of Canada until Parliament could be convoked. By Sept. 10, Parliament had assembled and acted, and a state of war between Canada and Germany was proclaimed by His Majesty The King in the following words:

"We do hereby declare and proclaim that a state of war with the German Reich exists and has existed in our Dominion of Canada as and from the tenth day of September, 1939."

**The General Organization of Canada's War Effort.**—As indicated, the immediate steps to organize the war effort were taken under authority of the War Measures Act of 1914 even before the United Kingdom declared war on Sept. 3; they were concerned with the defence forces. The militia, naval service, and air force were placed on active service, and certain other provisions were made for the defence of the coasts and for internal security.

The establishment of the first special economic organization—the War-time Prices and Trade Board—was announced the night of Sept. 3; it was charged with the duty of protecting the Canadian public against increases in the costs of the necessities of life. The "Defence of Canada Regulations" and other emergency regulations under the War Measures Act were brought into force and the censorship organization was established.

At the emergency session of Parliament ten measures were enacted. These measures included financial provisions to meet the cost of the War (see pp. 1131-1133) as well as an Act providing for the creation, when necessary, of a Department of Munitions and Supply.

Several months of what might be termed the organizational phase of Canada's war activity followed. Immediate consideration was given to the most effective way in which Canada could make her maximum contribution to the War. Consultations were held with the Allied authorities and their views were learned. Certain programs were announced and put into operation immediately. These included the preparation of two Divisions for overseas service and the doubling of the strength of the Canadian naval service. Representatives of the United Kingdom, Australia, and New Zealand came to Canada at the suggestion of the United Kingdom, and conferred with the Canadian authorities on the establishment of the British Commonwealth Air Training Plan. The Agreement on the details of this plan was signed on Dec. 17. Action had already begun to put it into effect (see p. xxviii).

On the economic side, organization proceeded equally rapidly. Plans made at that time were based on the assumption that the War would last at least three years, and that economic forces might well prove to be the determining factor in bringing

victory. Consequently, the creation of an effective economic war organization was an essential part of the war effort. This is dealt with in detail at pp. xxxi-xxxvii.

The various economic agencies, together with internal and subsidiary organizations that have developed out of them, have enabled the transition from a peacetime to a war-time economy to be made smoothly. This transition was marked by rapid economic expansion until January, with only a very minor set-back in the following two or three months despite the relatively sharp recession in the United States.

By the time the new Parliament assembled on May 16 the War had entered a new and much more active phase. Germany had successfully invaded Denmark and Norway in April, and on May 10 had commenced the 'blitzkrieg' against Holland, Belgium, Luxemburg, and France. Holland was conquered, and the Germans had broken through into France the day before Parliament met. Parliament acted quickly to meet the new emergencies. A War appropriation of \$700,000,000 was the first measure passed. The powers of the Minister of Munitions and Supply were revised and enlarged in the light of experience and necessity. On May 20 the Prime Minister announced, among other changes, that the 2nd Division would be dispatched overseas as soon as possible, that a Canadian Corps would be formed in the field, and that a 3rd Division would be raised. A Minister of National Defence for Air was appointed. It was later decided to recruit as soon as possible some units of a Fourth Division and to raise, from veterans of the War of 1914-18, certain forces for guard duty in Canada. Additional precautions were taken to meet the dangers of sabotage or treachery in the light of experience in Norway and the Low Countries. Dangerous and subversive elements were arrested or interned. The greatly increased demand for supplies and equipment in Britain and France had important effects on the Canadian supply situation and also on training. Allied orders for equipment and munitions were greatly accelerated. Much greater supplies were to be needed for Canadian forces, and much of those normally obtained from the United Kingdom would have to be obtained in Canada or elsewhere. All aircraft, equipment, and munitions that could possibly be spared were rushed to the United Kingdom in answer to her urgent requests. As a consequence, various special measures were taken by the Department of Munitions and Supply to accelerate orders and production. The diversion of equipment and of personnel to Great Britain necessitated some revisions in the Air Training Plan, but it was stated that the construction of aerodromes in Canada and other work related to the Plan would be accelerated.

War was declared on Italy when that country declared war on the United Kingdom and France. The climax to the legislative action consisted in the introduction and passage, during the third week of June, of the National Resources Mobilization Act, authorizing the Governor in Council to require "persons to place themselves, their services and their property at the disposal of His Majesty in the right of Canada as may be deemed necessary or expedient for securing the public safety, the Defence of Canada, the maintenance of public order, or the efficient prosecution of the War, or for maintaining supplies or services essential to the life of the community", with the exception that persons could not be compelled to serve in the armed forces outside of Canada and her territorial waters. It was announced that a National Registration of Canada's man-power would be instituted at once. A second War Budget of June 24, provided for substantial increases in taxes (see p. xxxv).

The following sections review in more detail the various war activities of the nation, first as regards the armed forces, and secondly in relation to economics and finance.\*

### National Defence.

**The Administration of National Defence.**—During the first eight months of war the defence of Canada was the responsibility of the Department of National Defence, as organized under the National Defence Act. This legislation, passed during the session of 1922, had consolidated the former Department of Militia and Defence, the Department of Naval Service, and the Air Board under one Minister; a Defence Council was set up by Order in Council to advise the Minister.

The ever-increasing responsibilities that the war brought to the defence services in Canada and the importance that the Air Arm was assuming in the defence picture, especially in relation to the British Commonwealth Air Training Plan, made it necessary to set up a separate Department of National Defence for Air in May, 1940. On May 22, the Air Ministry Bill (amending the National Defence Act) providing for this Department received Royal Assent. The Hon. C. G. Power, Postmaster General, was made Minister of National Defence for Air and in addressing Parliament in support of the Bill he warmly commended the move, pointing out the arrangements for closest co-operation between the Defence Departments and the absence of conflict of authority.

After the accident in June that deprived the Dominion of the services of the Hon. Norman Rogers, Minister of National Defence during the early months of war, Colonel the Hon. J. L. Ralston became Minister of National Defence, and the National Defence Act was again amended on July 8, 1940. Changed conditions in Europe and the increased importance of the Navy, not only in the defence of Canadian coasts and harbours but in co-operation with the naval forces of the United Kingdom, resulted in the Government's decision to add to the existing Defence Departments a separate Department of National Defence for Naval Services. The Hon. Angus L. Macdonald, Premier of Nova Scotia, was appointed Minister of National Defence for Naval Services.

Provision was also made for the appointment of an Associate Minister of National Defence in order to facilitate the work of the Department, make it possible to have ministerial attention given to vitally important matters, and help to avoid congestion by providing two outlets instead of one. Mr. Power, who had been Acting Minister of National Defence for extended periods, while retaining the portfolio for Air also became Associate Minister of National Defence with the Hon. J. L. Ralston. The Department thus had the benefit of his recognized organizing ability and the experience he has acquired in the many phases of departmental activities. Matters dealt with from time to time by the Minister and the Associate Minister, respectively, are adjusted entirely between the Ministers concerned, the Government being always finally responsible. The Minister of National Defence is the Senior Minister with directing and complete ministerial authority.

**The Army.**—Prior to the War a joint Naval, Army, and Air Plan had been prepared for the defence of Canada in the event of a major war. It was on this Plan that the actions taken by the Militia Service were based during the period leading up to, and immediately following, the outbreak of war.

In so far as the Militia Service was concerned the 'Defence of Canada' envisaged the following principal defensive measures:

\* See unrevised Hansard for July 29, pp. 2233-2235, and for July 30, pp. 2260-2277, where this subject is debated.

1. *Coast and Anti-Aircraft Defence.*—The mobilization of local garrisons required for the defence of seaports and harbours on both coasts of Canada and the manning of coast defence and anti-aircraft armament.

2. *Protection of Vulnerable Points.*—The provision of guards for certain vulnerable points of national importance on railways, canals, and elsewhere.

3. *Reserve Force.*—The mobilization of a reserve force in Canada; such troops to provide an expeditionary force for overseas if and when required.

On Aug. 25, 1939, the Government decided to man all coast and anti-aircraft defences as a precautionary measure. The Non-Permanent Active Militia forces required were called out on a voluntary basis. The response was excellent and more than adequate for the occasion. Further precautionary measures were taken on Sept. 1, 1939. By Sept. 10, when war was declared, the mobilization of the coastal garrisons was well advanced and was completed during the succeeding weeks.

At the same time the Government also decided that protection should be afforded to all vulnerable points that were considered of vital importance to the national war effort. As in the case of the coastal garrisons, the guards were formed from the Non-Permanent Active Militia. The units selected for this duty instantly responded to the call and within a few days guards were placed at all points except a very few in remote parts of the country. Towards the end of the year a change in policy was introduced and the Royal Canadian Mounted Police took over the protection of the majority of the vulnerable points.

On Sept. 1 the Government authorized the mobilization of a reserve force. The mobilization was carried out in accordance with plans prepared in peace-time, the organization of the force being based, with a few minor exceptions, on existing units of the Militia. The composition of each division of the force was carefully worked out in advance, to give proportional representation on a basis of population to every part of the Dominion.

In October a decision was taken by the Government to dispatch the 1st Division and some ancillary troops overseas. The organization of the 1st Division was, therefore, pressed to completion as quickly as possible, and arrangements for its transportation abroad were made in consultation with the British authorities. Elaborate and thorough precautions were taken to safeguard the convoys. By the end of January, 1940, the 1st Division, with a quota of ancillary troops, was concentrated overseas, where training was to be completed.

At the outbreak of war, living accommodation for troops in Canada was practically non-existent, the small number of Permanent Force barracks being completely occupied by Permanent Force units. It was, therefore, necessary to provide accommodation for all of the C.A.S.F. immediately, either by taking over existing commercial buildings that could be adapted for use as barracks, or by building war-time hutments. The policy adopted was to utilize existing buildings wherever possible, and to construct hutments only in localities where buildings were not available. Rehabilitation of existing buildings was begun very shortly after the commencement of mobilization and was continued as rapidly as the buildings could be acquired. All accommodation was completed and occupied by the troops by the end of November. The accommodation provided has been on a reasonably liberal scale as to space, and everything practicable has been done to make the troops comfortable and to protect their health.

In order to maintain units of the Canadian Active Service Force at war establishment, it is necessary to provide a steady flow of trained reinforcements to replace casualties that may be expected to occur overseas and at home. In order that reinforcements may be trained, an estimate of wastage over a considerable period

must be made, based on statistics accumulated in the past and adjusted, as well as can be foreseen, to the conditions of the present War. Reinforcements for the C.A.S.F. are being provided through the medium of depots and training centres. The men are enlisted at a depot and then proceed to a training centre in the district in which the unit was mobilized. Training units for the various arms have been established in many centres across Canada.

On May 21 the Government authorized the mobilization of an additional division for service in Canada or overseas, as might be required; soon after, the mobilization of still another division was authorized. As was the case in the first instance, the organization of these additional divisions was based on existing units of the Militia and their composition was worked out most carefully to give proportional representation, on the basis of population, to every part of the Dominion.

In May the Government also authorized the formation of thirteen companies of Veterans Home Guards, to be composed entirely of veterans of the War of 1914-18 and to be stationed at various points in Canada for home defence, as circumstances might require. This was immediately followed by the authorization of reserve companies of Veterans Home Guards. These reserve companies were to be formed, as may be deemed necessary, in various parts of Canada and were to be attached to units of the Militia for training and administration.

On June 18 further measures for home defence were taken by the Government when all Militia infantry units were authorized to recruit to full establishment where such a course was possible, having regard to armoury accommodation and training facilities available. Development work in connection with the provision of special types of mechanically propelled vehicles has been energetically pressed, and substantial orders for the requirements of the C.A.S.F., aggregating over 10,000 vehicles, had been placed. Of this total 7,500 were vehicles of special types, for which a large number of specification data and manufacturers' drawings had to be prepared.

A bill authorizing the conscription of the man-power for service in Canada and of the material resources of Canada for the prosecution of the War was passed by Parliament on June 19.

In the early part of July the formation of the Canadian Forestry Corps was authorized. This Corps is to provide companies of skilled personnel to assist the British Government in exploiting the timber resources of Great Britain for the furtherance of the war effort, and to economize on shipping.

On July 15 the Government announced the formation in the United Kingdom of a new Corps, to be composed of both United Kingdom and Canadian troops, including the 1st Division.

**The Air Force.**—Canada's numerically small but efficient air force responded quickly to the call to active service when war broke out in September, 1939. The highly trained peace-time nucleus was expanded quickly to meet the needs of war. Even while pre-arranged plans for building the Royal Canadian Air Force to war-time strength were being put into effect, the various permanent squadrons moved by air to their war stations.

Squadrons from central Canada flew to the Atlantic and Pacific Coasts to supplement naval and military defence forces. On the Atlantic, in co-operation with the Royal Canadian Navy and allied naval units, R.C.A.F. bombers and flying boats ranged far out to sea in search of enemy raiders. An unceasing coastal patrol was maintained from the air, convoys were escorted for the first few hundred miles of their journey across the ocean, and low-flying planes watched the depths for submarines. Special air squadrons became the eyes of the long-range coastal defence guns.

It was announced early in the War that Canada would be called upon to provide trained airmen for overseas service. Thereupon training plans were formulated on a large scale. Auxiliary air-force squadrons (the non-permanent units) were trained intensively for active service and made up a large percentage of the personnel of the composite squadrons formed during the autumn and winter.

Equipment was expanded as rapidly as possible in order to provide training facilities and to equip the squadrons necessary for home defence. It was announced in May that nine home-defence squadrons had been organized out of an estimated twelve squadrons required for that duty. In addition, three squadrons of the R.C.A.F., together with equipment, replacements, and reinforcements, had been dispatched overseas.

Agreement of the four Governments concerned, on the principle of the British Commonwealth Air Training Plan, was announced on Oct. 10, 1939, and, by early November, representatives of the United Kingdom, Australia, and New Zealand had all arrived in Ottawa to work out the details of the Plan with the Canadian Government. A joint Agreement for the large-scale training of air crews was signed Dec. 17; under this Agreement the Commonwealth partners are to share *pro rata* in the training program, the total cost of which was estimated at \$600,000,000, with Canada's share \$350,000,000. The Agreement runs until Mar. 31, 1943, but it may be extended by mutual consent.

The Plan calls for progressive establishment of 71 training schools for pilots, air observers, air gunners, and wireless operators from Australia, New Zealand, the United Kingdom, and Canada. The schools, supplemented by technical branches for maintenance and supply, will require a maintenance and instruction personnel of about 40,000 persons.

The United Kingdom and the participating Dominions agreed to have their recruits temporarily attached to the R.C.A.F. for the training period on Canadian soil, and Great Britain sent over 71 officers and 200 trained airmen specialists for administrative and instruction duties.

In keeping with the co-operative nature of the program, the whole Plan is administered by the Canadian Department of National Defence for Air, assisted by a Supervisory Board at Ottawa composed of three Canadian Cabinet Ministers, representatives of the other participating governments, the Deputy Minister of National Defence for Air, and the Chief of the Air Staff.

Construction of the necessary additional aerodromes and hangars and other buildings went forward throughout the winter in co-operation with the Department of Munitions and Supply and the airport engineers of the Department of Transport.

Under the joint Agreement, the United Kingdom was to supply the bulk of the training aircraft, equipment, and armament, supplemented by Canadian-made aircraft and some purchased in the United States. However, because of developments in the spring, Britain needed all available aircraft at home and the normal delivery of planes to Canada was interrupted. In the emergency, Canada ordered a shipment of aircraft *en route* to Canada to be turned back to the United Kingdom. At the same time, all available aircraft that could be spared by Canada were rushed overseas. Canadian pilots, trained as instructors, were diverted to active service.

To meet the interruption of aircraft supply from Great Britain, immediate steps were instituted to increase Canadian production and to seek elsewhere the aeroplanes needed for the training schools and for replacements for the home-defence squadrons.

**The Navy**—At the outbreak of hostilities, the Naval Staff was enlarged to cope with the new responsibilities and sudden expansion demanded by events. As

of September, 1939, the combined total of Canadian naval personnel, both permanent and reserve, was 3,604; ten months later the number had increased to over 9,000, all of whom were on active service. Reserve units reported many more applicants than it was possible to handle. In addition to the permanent and reserve members, some men and craft of the newly formed Fishermen's Reserve on the West Coast were called up and did yeoman service in their new duties.

The task of the Navy in time of war is twofold: to protect Canada's coast and its coastal waters; and to guard all shipping both approaching and leaving its shores. To do this, there must be complete accord and understanding between the various commands responsible for these duties, the Admiralty, the Ministry of Shipping, and other British authorities. Since the start of the War, the closest co-operation between the Royal Navy and the Royal Canadian Navy has been maintained at all times; this accounts in no small way for the fact that members of either fleet can at a moment's notice be transferred to the other without any delay being occasioned for additional training.

One of the most perplexing problems facing officials of the Royal Canadian Navy is that it must protect two coasts divided by 3,000 miles of land, the shortest line of marine communication being about 14,000 miles via the Panama Canal. The gigantic construction program already under way is rapidly relieving the strain placed on the protective force and a competent patrol fleet will be available when the present contracts are completed.

Protection and expansion were emphasized from the beginning. H.M.C.S. *Assiniboine* of the flotilla-leader type was acquired from the Royal Navy and added to the force of six destroyers already a part of the Royal Canadian Navy. Seventy-five vessels of all types were pressed into service as minesweepers, patrol vessels, etc. Some of these were bought outright both from other branches of the Government and from private interests. Some, indeed, were donated to the naval cause by public-spirited citizens of the Dominion. Three liners of the "Prince" class, owned by the Canadian National Railways and used as luxury cruise liners to the West Indies and coastwise excursions on the Pacific, were bought by the Navy for conversion into armed merchant cruisers. A two-year building program was launched and contracts for ninety modern patrol vessels were given.

Unlike the War of 1914-18, when the greater share of convoy duty both to and from Canada was undertaken by the Royal Navy, the Dominion, from the very beginning of hostilities, assumed a fair portion of the responsibility for patrol duty of trans-oceanic convoys. Halifax, from which large numbers of vessels sail under the watchful eye of the North Atlantic Patrol, composed of ships from both the Royal Navy and the Royal Canadian Navy, has become one of the most important ports in the world. The convoy duty is one of the most important functions for which the Canadian Navy is responsible as these armadas carry to Great Britain the vital foodstuffs that are the very lifeblood of the nation. Troop convoys, although equally important, make up a very small percentage of the total sailings.

Elaborate preparations have been made for protection of this all-important base. Anti-submarine nets seal the entrance of the harbour and along the shore modern, long-range guns stand guard day and night. Bombers keep a watchful lookout from overhead and small patrol craft skim over the water. The latest and most efficient defensive equipment, developed by British naval engineers in recent years, has already been installed and more is to be added. Other ports have also been fortified.

From Naval Service Headquarters at Ottawa, control of merchant shipping is maintained, including the administration of Naval Control staffs.

As in the War of 1914-18, when 1,700 men from Canada saw service in ships of the Royal Navy, young men from the Dominion are being trained as members

of the Royal Canadian Naval Volunteer Reserve and some are being transferred to the Royal Navy, following a rigorous period of training in their own country. This training period usually begins with three to four months' drill and lectures at the divisions in the principal Canadian cities. Upon transfer to one of Canada's coasts, this training period is continued, with practical experience in many of the finer points of naval technique.

By June, 1940, the first detachments of officers from the Royal Canadian Naval Volunteer Reserve completed training in England. The first group, 50 in number and all sub-lieutenants, so impressed the Commanding Officer of the training establishment where they were stationed that he forwarded a memorandum to the Chief of Naval Staff, in which he said he and his staff officers were "greatly impressed by their keenness and bearing" and that "without doubt such material will be a very valuable asset to the Royal Navy. Some of the young officers have been detailed to important duty in close contact with the enemy and have acquitted themselves admirably".

Canadian Naval vessels have been on 24-hour duty since the outbreak of the War, not only on convoy service but on patrol work as well. Some units have seen service in the Caribbean Sea and European waters, and on several occasions they have played important roles in the capture of enemy ships. One vessel of the Royal Canadian Navy has been lost to date, viz., H.M.C.S. *Fraser*. The official announcement of the disaster, read in the House of Commons by Prime Minister King on June 28th, ran as follows: "Naval Service Headquarters regrets to announce that while engaged in the pursuance of hazardous duties off the mouth of the Gironde River near Bordeaux, France, H.M.C.S. *Fraser* was lost". Of the total complement of 160 officers and men, 45 were reported dead or missing. A sequel to this sinking was the sterling work done by another Canadian naval vessel, H.M.C.S. *Restigouche*, in rescuing a majority of the survivors in the dead of night, despite bad weather conditions.

Soon after, H.M.C.S. *St. Laurent* rescued upwards of 700 persons from the *Arandora Star* which was torpedoed *en route* to Canada with German and Italian internees. For gallantry displayed during the evacuation from France, three officers of the Royal Canadian Naval Volunteer Reserve were awarded Distinguished Service Crosses while three others were mentioned in dispatches; these were the first awards made during the War to Canadians serving overseas as members of Canadian units.

To replace the *Fraser*, H.M.C.S. *Margaree*, a class D destroyer, was acquired from the Royal Navy and commissioned for service in late August, 1940.

### **The Economic Effort and the Organization Established for its Effective Operation.**

Modern 'total war' requires the effective mobilization of economic forces to equip and supply the fighting forces and to maintain the civil population while as much as possible of the national effort is devoted to war. For Canada this has implied that, in addition to providing men and materials for her own fighting forces, she must, to the maximum of her ability, furnish her Allies with food, munitions, equipment, and raw materials.

Canada is much better able to aid in these directions than she was in 1914 because the industrial structure, as well as agriculture, is much more fully developed. The true measure of a country's ability to wage war must always be the power to adapt, expand, and adjust its production to meet the ever-changing requirements of war. The available margin of production above what is needed for consumption, and the ability to mobilize it quickly, are the real things that determine

what can be done. Canada has ample resources of labour, capital, and material, some of which have been unemployed, and it should be possible for her to divert a great deal of production to war purposes without a too drastic temporary reduction in the standard of living.

Taken as a whole, the nation's equipment for production has never been worked to capacity. When account is taken of this and the reserve of labour available, it seems clear that under the stimulus of war-time demands production can be substantially increased even without longer working hours or the employment of those not normally seeking work. A vast emergency reserve exists beyond this in the increased production that would be made possible by sacrificing leisure and working more intensively. The margin of this production that can be spared for war depends upon the extent to which consumption can be reduced and capital outlays and replacements postponed. It should be realized that these emergency measures are not necessary until available and unemployed resources are brought into production and until production generally can be usefully and effectively diverted to war-time purposes.

Study had been made of Canada's possible war-time requirements before hostilities broke out, and consequently it was possible to set up quickly the emergency organizations needed. The Defence Purchasing Board had been established in July and had begun to function actively before war was declared. Under war-time conditions it was realized that a Board with wider powers, which would include not only purchasing but, when necessary, the organizing and directing of supply, would be needed. As a result, the Government set up the War Supply Board with these broader powers, which took over the work of the Defence Purchasing Board on Nov. 1, 1939. A War Purchasing Mission arrived in Canada in September from the United Kingdom and, after careful study of the supply field, it requested the War Supply Board to act as its purchasing agent in Canada. A prominent Canadian industrialist was appointed Director General of British (and French) Purchasing in the United States, and it was arranged that he should also direct purchases for the Canadian Government in that country.

On Apr. 9 the War Supply Board was superseded by the Department of Munitions and Supply, which retained and expanded the organization and personnel that the Board had built up. As the need for supplies became more acute, the purchasing work of the Department was extended and accelerated. On May 22 the Acting Minister of Munitions and Supply stated in the House of Commons\* that the Department and its predecessor Boards had purchased \$225,000,000 worth of equipment, material, and munitions for the Canadian forces and \$75,000,000 worth of orders for Great Britain and France. The Department has also commenced to exercise some of the broader duties conferred upon it to examine into and organize sources of supply. In this connection it has set up four Controllers to deal with steel, oil, timber, and mines and metals, respectively. A War-time Industries Control Board, composed of these Controllers, was formed to co-ordinate their work. In addition, several Government-owned corporations have been established to carry out special functions in connection with the purchasing of equipment, supplies, or materials necessary for war purposes.

Within a few hours of the outbreak of war in Europe, the Government took steps to protect consumers in this country from shortages and profiteering by setting up the War-time Prices and Trade Board. This important body, composed of senior civil servants, was charged with responsibility for arranging supplies of necessities where shortages appear likely, for controlling prices in such a way as to prevent

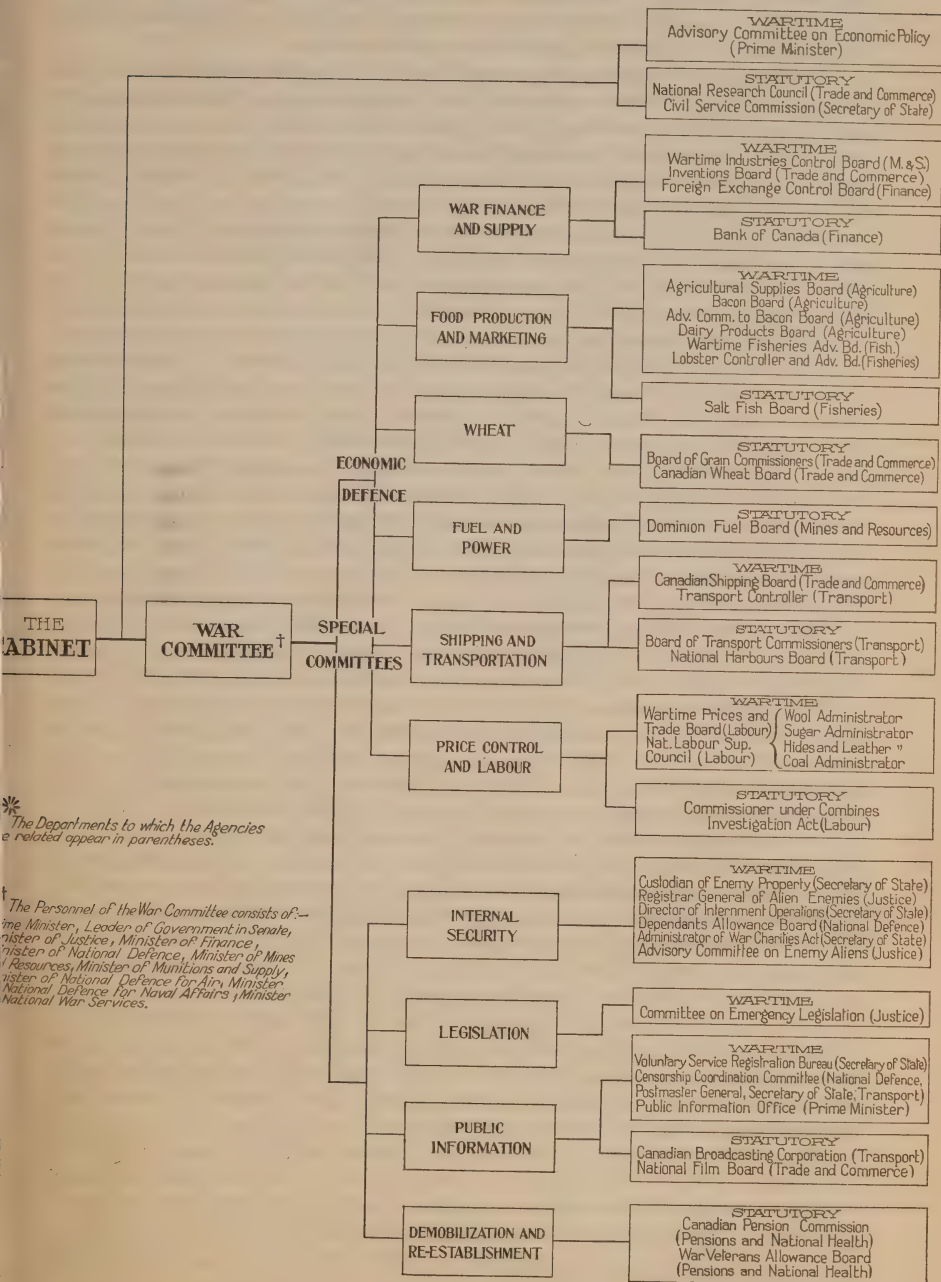

\* The speech appears at pages 142-149 of unrevised Hansard and contains much information on the supply situation as it existed at that time.

# WAR ORGANIZATION

## CABINET COMMITTEES AND RELATED AGENCIES

### CABINET COMMITTEES

### RELATED AGENCIES \*

\* The Departments to which the Agencies are related appear in parentheses.

† The Personnel of the War Committee consists of:—  
Prime Minister, Leader of Government in Senate,  
Minister of Justice, Minister of Finance,  
Minister of National Defence, Minister of Mines  
& Resources, Minister of Munitions and Supply,  
Minister of National Defence for Air, Minister  
of National Defence for Naval Affairs, Minister  
of National War Services.

profiteering and, when and where necessary, for instituting systems of rationing and control. Special administrative organizations have been appointed by the Board to deal with such commodities as sugar, wool, hides and leather, and coal. The Board was given wide powers to make and enforce regulations and has, in general, secured the widespread co-operation of producers and traders alike.

Because agricultural supplies are an important Canadian contribution to the support of the Allied Powers in the War, and because war poses special problems for agriculture, the Government appointed a special Agricultural Supplies Committee (later changed to a Board) to deal with problems of agricultural supplies and marketing under war-time conditions.\* The Board has been active in arranging that exports of essential foods and fibres to the United Kingdom be stimulated and also in meeting the difficulties arising from the dislocation of Canada's normal export trades. A Bacon Board was set up to deal with exports of bacon and hams to the United Kingdom under the agreement concluded by the two Governments. It commenced operations on Jan. 20. A Dairy Products Board was later established to deal, in a somewhat similar way, with exports of cheese and other dairy products.

The Canadian Shipping Board was established in December, 1939, succeeding the Ship Licensing Board. It has some control of the Canadian Merchant Marine, assists in obtaining shipping space for Canadian export trade, and in general deals with Canadian shipping problems. Mention should also be made of the Voluntary Service Registration Bureau which keeps a record of all men and women who have indicated their willingness to take part in war-time activities of all kinds. The National Labour Supply Council, composed of representatives both of labour and of employers, was established in June, 1940, to advise the Minister of Labour on all matters touching upon the supply of labour for war purposes. Other boards, agencies, or controllers have been established to deal with certain minor economic fields.

Being aware that it is essential to have an understanding of economic problems as a whole, as well as in particular, and that proper co-ordination of all economic activities and controls is necessary to produce the maximum war effort, the Government appointed an Advisory Committee on Economic Policy to advise the Cabinet directly on these broad questions. This Committee is made up almost entirely of senior civil servants who are thoroughly familiar with both the principles and the practice of economic affairs, and it has played an active role in assisting the Cabinet by reporting to it on many questions of economic and financial policy.

After the enactment of the National Resources Mobilization Act, a Department of National War Services was established in July, under a separate Minister, to undertake the National Registration of Canadian man-power, and also to co-ordinate and develop the various voluntary war services throughout the country. The new Minister and Department were also to take over the existing government information and publicity services in connection with the War. The most urgent immediate task of the new Department was the preparation for the National Registration. It was announced that this was to take place Aug. 19, 20, and 21. Preliminary preparations had previously been made for some aspects of this registration by an interdepartmental committee under the chairmanship of the Dominion Statistician. The new Department, with the co-operation of the Chief Electoral Officer, quickly laid the plans for the nation-wide task of registering every man and woman in the country, with information as to their age, status, education, and occupational experience. The most immediate use of the registration will be for the selection of single men of specified age groups to be called up for military training for service in Canada. Provisions have been made to ensure that this calling up is done in

\* The Minister of Agriculture described the War organizations related to his Department in the House of Commons on May 23, 1940 (see unrevised Hansard, p. 183).

such a way as to cause the minimum interference with production in essential industries. The registration will also be used as a source of information on manpower available for other essential work in war-time.

The war economic organization as at June 30 is shown in the chart at p.xxxiii.

**The Financing of Canada's War Effort.**—Since the War of 1914-18 Canada has become much stronger financially and, indeed, has now a well-developed and relatively mature financial system, both public and private. The keystone of this structure was placed in 1935 by the establishment of the Bank of Canada. On entering this War the Dominion had, therefore, sufficient financial machinery to carry out the heavy tasks that war demands. Canadians have learned not only to save but to invest their savings through the strong financial institutions, such as banks, insurance and trust companies, and also directly in bonds and shares. They are more able now than in 1914 to understand readily and to respond to what is required of them financially. Moreover, far more is known about the country's financial capacity, due to the valuable statistics that are collected and published. The statistics show, among other things, that in recent years Canada has been able to export substantial amounts of capital which have been used, in the main, to reduce indebtedness abroad.

The major financial problem of the War is, of course, to obtain the money to pay the cost of equipping and maintaining the Canadian forces. In addition, however, Canada has undertaken to assist the United Kingdom in obtaining the Canadian dollars needed for British purchases in Canada. While the United Kingdom is able to pay for a large part of what she buys in Canada either with the proceeds of her sales to Canada, or with cash, there is a considerable excess to be paid for otherwise. Canadian dollars for the payment of this excess are provided by the repatriation of securities, under arrangements by which Canada buys back or reduces in dollars Canadian securities that have been held in London. Most of this process is carried out directly by the Governments, the Canadian Government raising Canadian dollars and paying them to the British Government in return for the securities that the British Government obtains in the United Kingdom and is able to pay for there in sterling.

At the emergency session of Parliament in September, 1939, an appropriation of \$100,000,000 was passed to cover war expenditures, and with this was lumped the unexpended funds of the Department of National Defence that had been voted at the first 1939 session. The first War Budget, which was brought down on Sept. 12 by the Minister of National Revenue, set forth the general policies of war finance that the Government proposed to follow, and introduced the first war taxes. The general policy outlined was to meet as much of the costs of the war by taxation as was possible without interfering with the volume and efficiency of production, and to meet the balance of the cost by borrowing the savings of the people at interest rates that would not be materially different from those of peace time. It was noted however, that in the early months of the war financial policy must be directed to encouraging a rapid increase of employment and production. In this Budget moderate increases were announced in income taxes and substantial increases were made in taxes upon certain luxuries and semi-luxuries, notably beverages and tobacco. An excess profits tax was enacted to divert to the Treasury a large part of increased profits arising from war-time conditions.

The first borrowing operation during the War was of a short-term character and was facilitated by a small and carefully controlled expansion in bank credit. The borrowing took the form of the sale to the chartered banks of 2-year 2 p.c. notes to the value of \$200,000,000. Of the proceeds of this issue about \$92,000,000

was devoted to the repatriation of Canadian securities held in the United Kingdom, in order to provide the latter with Canadian dollars as explained above, about \$28,000,000 was for meeting maturing obligations in Canada, and the remaining \$80,000,000 was available for meeting current expenses.

By January it was considered that production incomes and savings had expanded sufficiently to ensure the success of a large public loan, and consequently the First War Loan was announced on Jan. 12. It took the form of  $3\frac{1}{2}$  p.c. bonds, issued at par, redeemable by lot over the five years 1948 to 1952, at par the years 1948 to 1950, at a premium of  $\frac{1}{2}$  p.c. in 1951 and 1 p.c. in 1952. The amount offered for cash subscriptions was limited to \$200,000,000 but the bonds were also offered in conversion for an issue maturing Mar. 1, 1940. Subscription lists were opened on Jan. 14, and the issue was oversubscribed within two days, but the lists were kept open until Jan. 19 to permit reception of subscriptions from distant points. Total cash subscriptions amounted to \$321,276,850, and conversion subscriptions to \$53,300,000. The amount allotted for cash subscriptions was \$200,000,000 and for conversion \$50,000,000. The total number of subscriptions received was more than 178,000, and nearly 46 p.c. was subscribed for in amounts of \$5,000 or less.

In the latter part of May a National Savings campaign was launched for the sale of War Savings Certificates and War Savings Stamps. The Certificates are offered in denominations of \$5, \$10, \$25, \$50, and \$100, and are sold for four-fifths of the face value. They mature in  $7\frac{1}{2}$  years, which gives a return of 25 p.c. on the money invested, amounting to 3 p.c. per year compound interest. The Stamps and Certificates are on sale by post offices, banks, many stores, and other dealers throughout the country. Special arrangements have been made to enable employees to purchase these Saving Certificates by regular deductions from their wages or salaries.

When Parliament assembled in May, a War Appropriation of \$700,000,000 was passed to meet the costs in 1940-41 of the greatly extended war effort. The Minister of Finance later stated in his Budget Speech that war expenditures during the fiscal year would probably exceed that figure and amount to \$850,000,000 or \$900,000,000. Estimates submitted to Parliament for other expenditures amounted to \$448,000,000, showing a substantial reduction from the corresponding figure of \$525,000,000 in the previous year. The second War Budget, brought down on June 24, provided for substantial increases in taxes to meet a portion of these additional costs of war. The graduated rates of the personal income tax were raised very substantially and exemption limits were reduced from \$1,000 to \$750 for single persons and from \$2,000 to \$1,500 for married persons. A National Defence Tax was introduced applying to married persons with incomes over \$1,200 and amounting to 2 p.c. of total income; for single persons the tax was to be 2 p.c. of income if the total annual income was more than \$600 but less than \$1,200, and 3 p.c. if total income was more than \$1,200. So far as possible this tax was to be deducted at the source. The Excess Profits Tax was entirely revised and made much more severe. In order to conserve exchange, a War Exchange Tax of 10 p.c. was imposed on all imports except those from the Empire. The excise tax on automobiles was made much more severe and steeply graduated in the upper brackets. The Minister of Finance estimated that these, and the other less important changes, would produce an increase of \$280,000,000 in tax revenue in a full year. The over-all deficit for the fiscal year 1940-41 was set at about \$550,000,000 or \$600,000,000 if war expenditures amounted to \$850,000,000 or \$900,000,000.

Among the most important financial war measures has been the establishment and operations of the Foreign Exchange Control Board. The Board was established and its powers defined in an Order in Council of Sept. 15 and control began the next

day. The Government took this step resolutely but reluctantly, because the commercial and financial ties between Canada and other countries, particularly the United States, are very close indeed and there has always been the greatest freedom of financial intercourse between Canada and the outside world. The supreme necessity of conserving Canada's capital and receipts of foreign exchange for war purposes made control essential. The Board has power to license imports and exports of goods, currency, and capital (as for example in the form of securities). All transactions with residents of other countries are subject to its regulations. It has in general adopted the policy of interfering as little as possible with normal business and travel, but of keeping outward movements of capital to the reasonable minimum made necessary by various considerations. Ordinary small transactions have usually been exempted from regulation and particular care is taken to see that tourists coming to Canada are not restricted in any way. Early in July, the Board, with the approval of the Government, ceased selling foreign exchange to Canadian residents for the purpose of pleasure travel, in order to conserve exchange for the purchase of essential war supplies.

On Apr. 30 a Foreign Exchange Acquisition Order was passed requiring all Canadian residents to sell their holdings of foreign exchange (but not of foreign securities) to the Foreign Exchange Control Board before the end of May. The Board permitted those who needed a current supply of foreign exchange in carrying on their normal business to retain enough for this purpose. At the same time the Bank of Canada also sold its gold reserves to the Board in order that all the nation's liquid reserves, both of gold and exchange, might be centralized in the hands of the agency responsible for managing the exchanges. The Exchange Fund, established in 1935 and used by the Board in its operations, was enlarged by \$325,000,000 in order to enable the Board to purchase the gold and foreign exchange referred to above.

### Economic Review, 1939-40.\*

The industrial outlook in Canada for the current year is and will be, to an increasing extent, associated with the character of war demands. There are also prospects of business from export fields by reason of the interference of war conditions with the ordinary trade channels and the fact that Canada occupies a preferred geographical and economic position in its ability to supply Empire needs under existing conditions.

At the outbreak of the present war, Canada faced the future with a near-record harvest, industry operating considerably below capacity, vast reserves of electric power and raw materials, over 750,000 persons on relief (a labour reservoir and potential recruiting force), banking assets at record levels, and a plentiful supply of capital available for investment.

The marked expansion in business operations during the first eight months of the present war is only a preview of future activity. Apart from the tax on Canadian production that the exigencies of war would in any case bring about, the German occupation of most of Europe and the strangulation of the normal sources of Allied supplies, especially food-stuffs, on that Continent have made it imperative that Canadian output be increased immediately to make up the deficiency.

A comprehensive index of industrial production from Sept. 1, 1939, to the end of April, 1940, showed an average gain of 17 p.c. over the corresponding period of the previous year. Practically all representative factors had places in the general advance and the initial changes in the turnover to a war economy were effected without undue dislocation. Strong governmental action served to allay fears of short-

\*Prepared by Sydney B. Smith, M.A., Statistician, Dominion Bureau of Statistics.

ages of raw materials, and prices consequently showed remarkable stability after an initial rise in the early months of hostilities. The wholesale price index rose less than five points from September to April and the cost of living has recorded little or no change since November, 1939.

**Agriculture.**—The volume of crop production in 1939 (142 p.c. of the crop year of 1913-14) reached the highest level since 1931 and the gross value of all agricultural production was estimated at \$1,171,000,000. The increase was due chiefly to a return of favourable crop conditions in Western Canada, particularly in Saskatchewan. The Canadian wheat crop totalled 490,000,000 bushels compared with 360,000,000 bushels in 1938 and it is estimated that the carry-over will be sufficient to offset any shortage should the crop of the present year be below average.

Following the favourable feed conditions of 1938, live-stock production for 1939 was at a high level. Output of hogs showed a gain of 14 p.c. as compared with 1938, while cattle marketings were 10 p.c. greater. Some decline from the high levels of 1939 was noted in marketings in the first quarter of the present year, but statistics for April indicate that the forward movement has been resumed. Butter production is now considerably in advance of 1939 levels and efforts are being made to compensate for the loss to Britain of Danish and Netherland supplies. Similarly, cheese output has been increased in the early months of 1940.

The effects of the war on agriculture have been somewhat uneven. While prices obtained for Canadian farm products rose, on the average, nearly 6 p.c. in the first eight months of hostilities compared with one year earlier, certain restrictions imposed by importing countries have operated to the disadvantage of such products as tobacco, apples, and canned fruits and vegetables, which are regarded at present as non-essentials by the allied importing countries. However, it is anticipated that the stimulus of war industries and large governmental expenditures will be reflected in increased demand for these farm products both here and abroad. Prices of farm products have increased more rapidly than prices of goods that the farmer must purchase, with consequent improvement in his net position.

**Mining.**—Canada's mineral production, valued at \$470,000,000, reached a new high in 1939, a gain of 10 p.c. over the preceding year. Metal prices have been largely pegged under government purchase plans (see p. 303) and the industry is being called upon to play a foremost part in the present struggle; it is able to produce abundant supplies of a greatly diversified list of minerals most essential to war industries.

New output records were established during 1939 in eleven metals and minerals. Iron ore was produced on a commercial scale for the first time in 16 years. Several new gold mines reached the production stage and 20 new mills began operation. The gold output from all sources passed the 5,000,000-ounce mark for the first time. In the production of base metals, Canada has held a leading place for many years. Production figures are given at pp. 314-319 of this volume.

Turner Valley continued to be the focal point of interest in the petroleum industry of Canada. Thirty-four new wells were brought into production and an extensive program of exploration was conducted. Production of crude petroleum and natural gasoline reached a new maximum at 7,743,000 barrels worth \$10,409,000.

In the first eight months of war, exports of Canadian base metals reached record levels and the output of gold increased over 3 p.c. from the corresponding period September, 1938, to April, 1939. Petroleum production also registered an advance of nearly 19 p.c.

**Manufacturing.**—Recovery in industrial activity took place after the early months of the year. The index of the volume of manufacturing production rose

from 107.5 in 1938 to 118.9 in 1939, a gain of 10.6 p.c. Industrial activity in Canada is based mainly on the utilization of domestic raw materials. Of the forty leading industries only the automobile, cotton textile, and petroleum industries are definitely unrelated to basic extractive activity within the Dominion: nevertheless, the prominent part played by manufacturing in the Canadian economy has led to large imports of certain raw materials including rubber, cotton, oil, silk, iron ore, and bauxite. Imports of sixty-five leading commodities required as raw materials for Canadian industries were valued at \$227,000,000 in 1938, or 33.5 p.c. of the total imports.

The forestry industries have been prominent in the recovery movement, the exports of planks and boards increasing 26.8 p.c. over the preceding year. News-print output increased 9.3 p.c.; expanding circulation in the United States, the elimination of overseas export shipments from Germany, and uncertainty over the future of Scandinavian shipments from the Baltic, have all combined to accentuate the usual seasonal pick-up in operations. Production in the last quarter of the year rose to over 75 p.c. of capacity, the highest level since 1937. The demands on the home market gave a stimulus to the British cotton trade and less attention was paid to exports, so that the primary cotton industry in Canada showed improvement during the year. The greater purchasing power in the western provinces and the reduction of imports was also a factor in a greater volume of business for Canadian mills. The domestic consumption of raw cotton was 128,100,000 pounds compared with 110,200,000 pounds in 1938. The output of steel showed a gain of nearly 20 p.c. Pig-iron production rose from 705,427 long tons to 756,182, a gain of 7.2 p.c. In the latter part of the year, the automotive industry had to contend with the adverse effects of war on external trade.

In the first four months of 1940, the index of manufacturing production averaged 26 p.c. above the same months of 1939 while in a comparison with the first eight months of war over the same months one year before, a gain of 21 p.c. was shown.

**Retail and Wholesale Trade.**—Average monthly sales by retail stores were 3 p.c. higher during 1939 than in 1938, nine of twelve lines of business reporting an increase. Sales for each of the first four months lagged behind figures for the same months of 1938. Then a series of increases began that, except for a slight lapse in July, continued throughout the remainder of the year and at a generally accelerating rate. The uncertainty attendant upon the outbreak of war in September caused abnormal purchasing and a gain of 12 p.c. in sales over September, 1938, was recorded.

The average annual index of sales by department stores was 3.5 p.c. greater than in 1938, declines in the early months being more than offset by gains in the latter part of the year. Annual increases ranging from 2 p.c. in British Columbia to 7 p.c. in the Maritimes were recorded.

Wholesale trade was 7 p.c. greater than in the preceding year. Results on a regional basis indicate that the improvements varied very little for each section of the country. Each of the nine classes of business showed increased sales in 1939. The footwear trade showed the largest improvement with sales up 19 p.c.; the clothing group was second with a gain of 11 p.c. in the year-to-year comparison.

**Fish and Furs.**—Since the domestic consumption of fish is relatively small, the industry depends largely on outside markets. Between 60 p.c. and 70 p.c. of the annual catch is exported, the United States taking about one-half and Great Britain one-quarter. The value of fish and fish products exported in 1939

was \$28,900,000, a gain of nearly 9 p.c. over the preceding year. The Atlantic deep-sea fisheries produced 5,449,300 cwt. compared with 5,201,000 cwt. in 1938, a gain of 4·8 p.c. in volume (but 2·6 p.c. in value). Conditions on the Pacific Coast were not so favourable, and the total production for the Dominion showed a slight decrease.

Measured by the export trade, the fur industry was slightly more than maintained in 1939. The outward shipment of furs was valued at \$14,600,000 during the preceding year. Present world conditions are unfavourable and export trade to Great Britain and Europe is adversely affected. Prices, particularly of luxury furs, are expected to decline.

**Transportation.**—Railway earnings have benefited from the upward swing in business activity and the heaviest crop in Western Canada since 1928. A considerable demand for transportation facilities has also developed in connection with Canada's war effort and much additional equipment was purchased during 1939. Railway freight shipments recorded a good increase over the preceding year, the total having been 2,548,964 cars compared with 2,428,526. In the first eight months of war, the revenues of the two main railway systems registered advances of nearly 25 p.c. for the C.N.R. and 16 p.c. for the C.P.R. as compared with the same months of the preceding year. Carloadings in the first thirty weeks of 1940 totalled 1,521,000 cars, a gain of over 221,000 cars or 17 p.c. over the same weeks of 1939.

Rapid strides in air transportation were made in Canada during 1939. The Trans-Canada Air Lines inaugurated main-line passenger flights from Moncton to Vancouver with feeder lines to the principal cities in each province and a daily mail service is now available. Assistance has been given to municipalities desiring to construct or improve existing airports. Nearly 2,000,000 pounds of mail and 22,000,000 pounds of freight were estimated to have been transported during the year.

**Shipping.**—Unsettled international conditions greatly disturbed the shipping world during 1939-40 and considerable confusion as to rates, insurance risks, embargoes, and controls has played havoc with normal movements. Shipping using the harbour of Montreal showed a decline of 12 p.c. in 1939 as compared with 1938, due in part to a late spring and to the increased use of nearby ports. Total inland shipping on the canal systems registered general improvement in 1939. The heavy movement of iron ore and wheat through the Sault Ste. Marie locks increased the total tonnage from 40,000,000 tons in 1938 to nearly 70,000,000. At Welland the reduction in the movement of corn and barley more than offset gains in coal, iron ore, iron and steel, and petroleum, the net result being a decline of 900,000 tons or 7 p.c. The St. Lawrence system also reflected the decline at Welland, the total dropping from 9,236,318 tons in 1938 to 8,340,165 tons. Statistics for the early months of 1940 show a further considerable advance in shipping through Canadian canals.

**Construction.**—The amount of new business obtained by the construction industry in 1939 was virtually maintained at the level of the preceding year. The total was \$187,178,500, of which \$82,600,000 was placed in Ontario. New construction and additions made up 12·2 p.c. of all construction for the year. The sum of \$23,565,400 in awards for roads was an increase of 40·8 p.c. over 1938.

Building permits were \$59,500,000 as compared with \$60,900,000 in 1938, a decline of 2·3 p.c. It is probable that building operations will not experience a notable slump such as occurred in 1915, in view of the extensive construction program contemplated for war purposes apart from private building. In the first six months of the current year, contracts awarded advanced 50 p.c. over the same months of

1939, while building permits also registered an excellent advance from \$26,900,000 to \$34,200,000, a gain of 28 p.c.

**Electric Power.**—The use of hydro-electric power has grown rapidly in Canada, and has played a prominent part in the development of Canadian industries (see Chapter XIII). The year 1937 recorded a peak of electric power production in the Dominion and 1939 showed a gain of 3 p.c. over that year. During the past decade the capacity of hydro-electric installations in Canada has more than doubled.

A survey of hydro-electric progress in Canada during 1939 shows that considerable activity took place not only in the installation of new generating capacity but also in the extension of transmission and distribution facilities in many parts of the Dominion. New water-power installations in the year under review aggregated 97,040 h.p., which brought the total at the end of the year to 8,289,212 h.p. The firm power made available in Canada for ordinary use, computed by deducting the sum of exports to the United States and the amount supplied for use in electric boilers, was 19,847,000,000 kwh., a gain of nearly 8 p.c. over the 18,435,000,000 kwh. made available in 1938.

**Employment.**—In the field of employment the year was featured by a sharp reversal in the downward trend occasioned by a late spring. The slackening in industry apparent during 1938 continued into the first four months of 1939. The commencement of seasonal operations, the Royal Visit, the revival in United States business, and increased buying of raw materials for armament purposes all served to start the index on the upward swing that was continued to a peak of 123.6 on Nov. 1—a gain of nearly 19 points from the April position and the third highest November figure on record. The year 1940 opened with employment at the highest point in history for Jan. 1 and, after seasonal adjustment, a high point for any month since September, 1929.

The net result for the year showed a moderate increase from 1938, the index having risen two points to 113.9. The main groups registering gains were manufacturing, mining, transportation, construction, services, and trade. Logging experienced considerable recession averaging 16.5 p.c. below the 1938 figure, while communications showed a minor decrease due mainly to technological improvements.

Employment was well maintained in 1940 as shown by statistics to May 1, when industrial activity was at a higher level than at the same date in any other year with the exception of 1929. The index of manufacturing employment reached a new record. Heightened activity was indicated in all provinces except Prince Edward Island.

Owing to improvement in general business, a near-record crop on the Prairies, and the war effort, a material decrease has been shown in the total number of persons on relief from 1,028,000 in March, 1939, to 768,000 in March, 1940—over 25 p.c. The greatest decline was shown in the number on agricultural relief. The number of wage-earners unemployed was placed at 367,000 in April of this year compared with 473,000 in the same month of 1939, a decrease of 22.5 p.c.

**Banking.**—During the past year the commercial banks continued to consolidate their strong liquid position. Assets, one of the best measures of expansion, reached a total of \$3,822,000,000 at the year end, a gain of nearly \$400,000,000 or 11 p.c. over the same date in 1938. The demand for current loans improved during 1939, the average being \$854,500,000 compared with \$786,100,000 in the preceding year. The peak, \$972,800,000, was reached at the end of November.

Bank deposits continued their upward surge to a new record. Total securities held by the banks were also at new highs, the monthly average reaching

\$1,540,000,000 compared with \$1,440,000,000 in the preceding year. Bank profits registered a minor advance over 1938.

At the end of April, 1940, total assets of the chartered banks showed an improvement of nearly 7 p.c. over the same date in 1939, while current loans were up about 15 p.c. in a similar comparison. Notice and demand deposits have been steady, advancing nearly 4 p.c. to more than \$2,500,000,000. Security holdings, at \$1,592,000,000 increased 5.5 p.c. over the same date one year ago. Note circulation advanced 18 p.c. compared with an increase of 13 p.c. in wholesale prices.

**Wholesale Prices.**—The reaction in wholesale prices noticeable during the first half of 1937 continued unabated until August, 1939. This movement was counter to that of industrial production which, both in Canada and on a world basis, showed an upward movement after a temporary low point had been reached in the early part of 1938. The outbreak of war was the signal for a sharp advance that continued during the last four months of the year. The standing in December, 1939, however, was 81.7 against 73.3 in the closing month of the preceding year. During the year the price index of raw and partly manufactured products advanced from 64.9 to 74.2. The rise in Canadian farm products from 64.6 to 69.1 was relatively moderate.

The effect of war on the wholesale price structure, as measured by the average for the first eight months of hostilities, was an advance of over 10.5 p.c. as compared with the same period one year previously; raw material prices increased 14 p.c. in the same period.

**External Trade and the Balance of Payments.**—Exports in 1939, exclusive of gold, were valued at close to \$1,000,000,000 (actually \$936,000,000) against \$849,000,000 in the preceding calendar year. The net export of non-monetary gold at \$184,800,000 was 15 p.c. greater than in 1938. Imports of merchandise were \$751,600,000 against \$677,500,000. The excess of exports over imports, excluding gold, was \$184,300,000 compared with \$171,200,000.

About three-quarters of Canada's exports during the past two years went to the markets of Great Britain and the United States. Owing to the lowering of tariff barriers and the revival of demand due to improvement in business conditions, the United States market has become much more important as an outlet for Canadian goods in the past twelve months. While Britain necessarily has first call upon Canada's surplus production, trade with other countries is also vital in maintaining a supply of foreign exchange for the Allied cause.

Canada's place as the world's fifth largest trading nation (estimated on the basis of total exports and imports) and the fourth largest exporting nation was maintained in 1939. The large active balance, characteristic of Canada's commodity trade in recent years, was continued. A marked expansion was also shown in the net export of gold supplementing the commodity balance. Canada's net interest and dividend payments to investors residing abroad continued as an important debit but the continued retirement of Canadian securities held abroad has greatly reduced the burden of external debt charges compared with a few years ago. The large net balance of credits in the current account indicated above was available for reducing external obligations. Canada's important tourist trade in its relation to external trade is dealt with at pp. 582-583 of this volume.

**Summary Index of Economic Conditions in Canada.**—A summary of economic conditions in Canada is best provided by the index of physical volume of business computed by the Dominion Bureau of Statistics. The index is a composite

of 46 significant factors and is based on the year 1926. The statement below gives the index by months for 1937, 1938, 1939, and the first half of 1940.

The monthly indexes for the first seven months of 1939 were, in each case, higher than those for the corresponding months of 1938, but lower than the 1937 figures. In August, however, the index rose sharply to the second highest point on record for that month. After the outbreak of war, the index continued to rise and from September to October rose over  $7\frac{1}{2}$  points to 133.1, setting a new high record; it remained at approximately this level until December but showed another gain for January, 1940. After a temporary seasonal slowing-up, the pressure of Canada's war effort forced the index to record levels in the second quarter of the current year.

## MONTHLY INDEX OF PHYSICAL VOLUME OF BUSINESS, 1937 TO MAY, 1940.

<sup>1</sup> Owing to a change in reporting trade statistics, March is artificially reduced and April artificially increased in all comparisons.

A development of some importance was the shift from the production of consumer goods to producer commodities. War orders persistently placed subsequent to the outbreak had an important bearing on industrial activity. A number of new plants were constructed and existing plants engaged on war demands accelerated operations.

As between producers goods and consumers goods, the monthly index of the former averaged 14.5 p.c. higher in the first ten months of war compared with the same months of the previous year, while, owing to active consumer buying in anticipation of price advances, the index of production of consumers goods rose over 9.9 p.c.

*ERRATA.*

P. 12, Table 3, read "sq. miles" for "ft." in right-hand column.

P. 137, line 8, for "Toronto had, in 1936" read "1938" for "1936".

P. 210, in introductory paragraph to Table 9, read "Table 8" for "Table 5".

P. 215, line 6, for "1940 clip" read "1939" for "1940".

## PART I.—GEOGRAPHICAL FEATURES.\*

**Situation.**—The Dominion of Canada comprises the whole northern part of the North American Continent with its islands, except the United States territory of Alaska and the territory of Newfoundland (which includes Labrador). It takes in the whole Arctic Archipelago between Davis Strait and the connecting waters northward to the 60th Meridian on the east and the 141st Meridian on the west.

The Dominion is bounded on the west by the Pacific Ocean and Alaska; on the south by the United States; on the east by the Atlantic Ocean, the waters between Newfoundland and the Gulf of St. Lawrence, Labrador, Davis Strait, and the dividing waters between the Danish territory of Greenland and Ellesmere Island; northward it extends to the North Pole.

The southernmost point is Middle Island in Lake Erie, in north latitude 41° 41', and from east to west Canada extends from about west longitude 57° at Belle Isle Strait to west longitude 141°, the boundary of Alaska. Canadian territory thus extends over 84° of longitude and 48° of latitude.

**Area.**—The area of the Dominion is 3,694,863 square miles, a figure that may be compared with that of 3,738,395 square miles for the United States and its dependent territories, 3,776,700 the total area of Europe, 2,974,581 the area of Australia, 3,275,510 the area of Brazil, 1,805,252 the area of India, 121,633 the area of the British Isles. Canada's area is over 27 p.c. of the total area of the British Empire as it is shown on p. 165 of the 1934-35 Year Book.

**Political Subdivisions.**—Canada is divided from east to west into the following provinces: the Maritime Provinces of Nova Scotia, Prince Edward Island, and New Brunswick, all three comparatively small in area; Quebec, covering a strip south of the St. Lawrence River and the whole territory north of the St. Lawrence River and east of the Ottawa River to Hudson Strait, except the Coast of Labrador; Ontario, extending northward from the Great Lakes to Hudson Bay; Manitoba, Saskatchewan, and Alberta, the provinces of the interior continental plain, extending from the boundary of the United States to 60° north latitude; and British

\*Revised by F. H. Peters, Surveyor General and Chief, Hydrographic Service, Department of Mines and Resources, Ottawa.

Columbia, the province of the Cordilleran region, also extending from the International Boundary to 60°N. North of the area included in the provinces the country is divided into the Yukon Territory to the west, abutting on Alaska, and the Northwest Territories. The latter is subdivided into three provisional districts: that of Mackenzie comprises the mainland between Yukon and the meridian of longitude 102°W.; the District of Keewatin comprises the remainder of the mainland between the District of Mackenzie and Hudson Bay, and includes the off-shore islands in Hudson and James Bays; the District of Franklin comprises, in general, the Arctic Archipelago.

*Prince Edward Island.*—This, the smallest province of the Dominion, lies just off the coast east of New Brunswick and north of Nova Scotia; it is separated from both provinces by Northumberland Strait from ten to twenty-five miles wide. It is about 120 miles in length and, with an average width of 20 miles, covers an area of 2,184 square miles, approximately 200 square miles more than the State of Delaware. The Island is almost trisected by the deep indentations of Malpeque Bay north of Summerside and by the mouth of the Hillsborough River at Charlottetown, which nearly meets Tracadie Bay on the north side. Its rich, red soil and red sandstone formations are distinctive features, and no point on the Island attains a greater altitude than about 450 feet above sea-level. Its climate, tempered by the surrounding waters of the Gulf and yet free from the rigours of Atlantic storms, combined with a fertile soil and sheltered harbours, offers great inducements to the pursuits of agriculture and fishing. The Province is noted for its relative predominance in the fox-farming industry, its lobster canneries, its oyster beds, and its production of seed potatoes.

*Nova Scotia.*—The Province of Nova Scotia is 381 miles in length by from 50 to 105 miles in width, a long, narrow strip of land lying parallel to the Maine and New Brunswick Coasts and joined to the latter province by the Isthmus of Chignecto, which is 15 miles in width. It includes to the north the Island of Cape Breton, which is separated from the mainland by the narrow Strait of Canso. The total area of the Province is 21,068 square miles, a little over 2,000 square miles less than the combined areas of Belgium and Holland.\* Cape Breton Island, south of the main entrance to the Gulf of St. Lawrence and sheltering Prince Edward Island from the Atlantic, is roughly 100 miles in length with an extreme breadth of 87 miles. Its area of 3,970 square miles encloses the salt-water lakes of Bras d'Or, connected with the sea at the north by two natural channels and at the south by the St. Peters Ship Canal. The ridge of low, mountainous country running through the centre of the Nova Scotia mainland, the highest altitude of which is less than 1,500 feet, divides it roughly into two slopes. That facing the Atlantic is generally rocky and open to the sweep of Atlantic storms, but the other, facing the Bay of Fundy and Northumberland Strait, consists, for the most part, of fertile plains and river valleys noted for general farming and for fruit-farming districts which produce the famous Nova Scotian apples. The Atlantic Coast is deeply indented with numerous excellent harbours, many of which provided splendid homes and refuges for the old sail fishing fleets. The Province is still the home of an extensive fishing industry. The mineral resources of Nova Scotia were among the first in the Dominion to be exploited as some of its coal deposits outcropped on the sea-coast. These valuable coal measures make Nova Scotia still one of the chief coal-producing provinces of the Dominion. In addition, there are extensive areas of gold-bearing formations and valuable deposits of gypsum.

*New Brunswick.*—With a total area of 27,985 square miles, New Brunswick may be compared in size to Scotland with its area of 30,405 square miles. The Province is very compact and in shape nearly rectangular, with its depth not greatly exceeding its width. The conformation is, in general, undulating and of low relief. In the southeastern half of the Province the ground elevation does not generally exceed 500 feet above sea-level except for a narrow strip in the south which produces the highlands bordering the Bay of Fundy east of Saint John. In the northwestern half the ground elevation is, in general, from 500 to 1,000 feet above sea-level and reaches its greatest elevation of about 2,690 feet in Northumberland County north-east of Grand Falls. The St. John, rising in the sister province of Quebec and the bordering State of Maine, is a river with many distinctive beauties, while its length of nearly 400 miles makes it quite noteworthy as to size. In the northeastern half of the Province there are very extensive areas of Crown lands still carrying valuable stands of merchantable timber. The Bay of Chaleur at the north, the Gulf of St. Lawrence and Northumberland Strait at the east, the Bay of Fundy at the south, and Passamaquoddy Bay at the southwest, provide the Province with a very extensive sea-coast. To its southwest is a group of islands belonging to the Province, the most important of which are Grand Manan, Campobello, and the West Isles. New Brunswick has been called "the best-watered country in the world"; numerous rivers provide access to extensive lumbering areas in its interior and to many of the most attractive hunting and fishing resorts in the Dominion. While its forest resources are an important economic feature, extensive areas of rich agricultural lands are found in the river valleys and the broad plains near the coasts. The Minto coal-fields have shown an expanding tendency recently though production has been on a moderate scale for many years, and the Province also produces a limited quantity of petroleum and natural gas.

*Quebec.*—Quebec might well be included among the Maritime Provinces, for with the St. Lawrence River, the Gulf of St. Lawrence, the Atlantic, Hudson Strait and Bay, salt water washes the coasts of the Province for a length of over 2,700 miles. Besides including a narrow strip of land between the St. Lawrence and the International and New Brunswick boundaries, Quebec extends northward from the St. Lawrence and Ottawa Rivers to Labrador and Hudson Strait, covering over 17° of latitude and an area of 594,534 square miles, about 38 p.c. of which lies south of the isotherm of 60° F. mean July temperature.\* The combined area of France, Germany, and Spain is about 2,600 square miles less than the area of Quebec. The conformity of the surface of Quebec is that characteristic of the Precambrian rocks, being quite even in general but much diversified by minor hills and hollows. North of the St. Lawrence the land takes the form of a ridge, parallel to the river and rising from sea-level to the Height of Land at an elevation of from 1,000 to 3,000 feet and then descending gently again to the sea-level of Hudson Bay to the northwest; but to the northeast the ridge carries its height to end abruptly in the high headlands of Labrador. South of the river, the area is comprised of the St. Lawrence Lowlands between Montreal and Quebec which, rising to the east, produce the highest known elevation in the province, viz., 4,160 feet, that of Jacques Cartier Peak of Tabletop Mountain in the Gaspé Peninsula. With the exception of the treeless zone extending somewhat south of Ungava Bay, most of the Province supports a valuable tree growth varying from the mixed forest in the southwest to the

\*The isotherm of 60° F. mean July temperature is generally considered as the northern limit for the economic production of cereals.

eastern and northern coniferous in the areas of higher latitude. Apart from its importance as the threshold of Canada and the Atlantic gateway through which ocean vessels must pass on their way to the interior of the continent, Quebec is also noted for its natural resources. The extensive timber limits of its northern areas form the basis for the great pulp and paper industry of this part of Canada. Its rivers, many of them as yet comparatively unknown, may be harnessed to supply about two-fifths of the electric power available in Canada. Its asbestos deposits have long been known for their quality and extent, while more recently there have been extensive developments of deposits of gold and copper in the western part of the Province, with further discoveries extending the mineralized area into the Chibougamau district. These developments have brought the Province up to third place in mineral production in Canada. The fisheries of the St. Lawrence River and Gulf are well known. Agriculturally, the climate and soil of the upper St. Lawrence River Valley and the plains of the Eastern Townships are eminently adapted to general farming operations.

*Ontario.*—The Province of Ontario is the section of the Dominion contained between the great international lakes and Hudson Bay and between the western boundary of Quebec and the eastern limits of Manitoba. Although generally regarded as an inland province, Ontario has a fresh-water shore line on the Great Lakes of more than 2,362 miles and on the north a salt-water shore line of about 680 miles with a tidal port at Moosonee at the southern end of James Bay. The southernmost point of Ontario, which is also the southernmost point of the Dominion, is in north latitude  $41^{\circ} 41'$ —a little farther south than the northern boundary of the State of California—and its most northern, in north latitude  $56^{\circ} 50'$ . The total area comprised within its limits, of which about 82 p.c. lies south of the isotherm of  $60^{\circ}$  F. mean July temperature,\* is 412,582 square miles, of which its fresh-water area of 49,300 square miles forms the unusually large proportion of 12 p.c. The Province is over 5,000 square miles greater in area than are France and Spain together, and when compared with the States to the south, Ontario is found to be almost equal in extent to the combined areas of the six New England States, together with New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Michigan, and Wisconsin. Except in the southwestern part, the surface conformity of Ontario is influenced by the characteristics of the Precambrian rocks. In northern Ontario a large area with elevations of 1,000 feet or over adjoins the north shore of the Great Lakes and, going north a short distance over the Height of Land, the slope descends very gently to Hudson Bay, which has a wide marginal strip less than 500 feet above sea-level. The highest point in Ontario is 2,120 feet, on the promontory at the north-eastern corner of Lake Superior. The whole Province supports a valuable covering of trees, varying, from south to north, from the mixed forest to the eastern and northern coniferous. Many varieties of climate and soil are encountered, from the distinctively southern conditions found along the shores of Lake Erie to the very different ones of Hudson and James Bays. Ontario, of all the provinces, is the centre of the country's manufacturing industries, owing to its abundant water-power resources and its proximity to the coalfields of Pennsylvania, but the many resources of its rural districts are not on this account neglected. Mining is a very important industry in the widespread Precambrian area and, although the most important districts are Sudbury, Porcupine, and Kirkland Lake, profitable mining operations, principally of gold, are now being carried on from the Manitoba boundary

\* See footnote, p. 3.

eastward across northern Ontario and down into eastern Ontario. Petroleum and natural gas, salt, and gypsum are also produced on an important scale in the south-western part of the Province. Fruit farming in the Niagara District and general farming throughout the entire southern part of the Province are carried on extensively under unusually favourable conditions, while timber, pulp, and furs are other important products of more northern parts.

*Manitoba.*—Manitoba, the most easterly of the Prairie Provinces, and also the oldest of them in point of settlement, includes the area between Ontario on the east and Saskatchewan on the west. Its southerly limit is the International Boundary, while its northerly boundary is the 60th parallel of latitude and Hudson Bay, where its coast of over 400 miles includes the harbour and port of Churchill. The total area of Manitoba, of which about 56 p.c. lies south of the isotherm of 60° F. mean July temperature,\* is 246,512 square miles—3,246 square miles greater than twice the total area of the British Isles. The conformity of the surface of Manitoba is quite even; commencing on the north with a strip bordering on Hudson Bay—perhaps 100 miles wide and less than 500 feet in elevation—the surface rises gradually towards the west and south. The bulk of the Province has an elevation of between 500 and 1,000 feet, and the greatest height of 2,727 feet is attained in Duck Mountain, north-west of Lake Dauphin. East and north of Lake Winnipeg the Canadian Shield is found with its Precambrian rock formation, but the remainder of the Province is overlain by very fertile soil of great depth. The treeless prairie belt extends into the southwest corner of the Province, but the greater portion of the developed area is in the grove belt, characterized by groves of poplar interspersed with open prairie patches; to the north there are great areas of northern mixed forest, blending into the northern coniferous, which thin again to some treeless areas along the coast-line farther north. The Province has been regarded as typically agricultural, its southern lands being specially adapted to this form of industry. Its northern districts, however, are of importance in the production of timber and furs and its numerous large lakes in the production of fresh-water fish, chiefly whitefish. About three-fifths of the area of this Province is underlain by the Precambrian rocks which have been found so rich in minerals in northern Ontario and Quebec. Two large deposits of copper-gold-zinc ore have been developed, south of the Churchill River near the Manitoba-Saskatchewan boundary, while to the east and north of Lake Winnipeg recent years have witnessed great activity in the prospecting and development of gold properties, a number of which are now producing. The Province also possesses important water-power resources in the rivers of the Precambrian area.

*Saskatchewan.*—This central prairie province lies between Manitoba and Alberta; it extends from the International Boundary on the south to the 60th parallel of latitude, which divides it from the Northwest Territories. The area, of which about 89 p.c. lies south of the isotherm of 60° F. mean July temperature,\* is 251,700 square miles, approximating that of Manitoba, and greater by 5,000 square miles than the combined areas of the British Isles and Norway. Approximately one-third of the total area, generally lying north of the Churchill River, is underlain by the Precambrian rocks which have been found so richly mineralized in other parts of Canada. The Flin Flon copper-gold-zinc deposit on the Manitoba-Saskatchewan boundary is an evidence of economic mineralization in the east, while in the Lake Athabaska region of the northwest promising discoveries of gold have been made recently. The northern districts, abundantly watered by lakes and rivers, in addition to potential mineral wealth, are rich in timber resources while the southerly

\* See footnote, p. 3.

two-thirds of the Province, overlain by generally fertile soil of great depth, includes a large portion of the famous western wheat fields. The larger part of the developed area in the south is comprised in the great treeless prairie belt, fringed to the north with a zone of poplar interspersed with open prairie, which gradually changes into the northern mixed forest covering all the northerly parts. Apart from the southern prairies, which are extraordinarily smooth, the surface topography is generally of low relief with a gradually rising slope towards the west. Most of the Province has a general elevation of between 1,000 and 2,000 feet, with the maximum elevation of about 4,500 feet on the eastern point of the Cypress Hills in the southwest corner. The climate in the southern parts is quite different from that of Eastern Canada, with less precipitation and perhaps more severe features than are encountered in many other parts of the country, but is nevertheless most favourable to plant growth, when sufficient moisture is available.

*Alberta.*—Lying between Saskatchewan on the east and the Rocky Mountains and the 120th Meridian on the west, and bounded on the north and south by the Northwest Territories and the United States, respectively, is the Province of Alberta. Its area is slightly greater than that of Saskatchewan or Manitoba, comprising a total of 255,285 square miles, of which about 90 p.c. lies south of the isotherm of 60° F. mean July temperature.\* The area of the Province is over 8,600 square miles greater than the combined areas of the British Isles and Norway. Like Saskatchewan, the southern part of the Province is comprised in the dry, treeless prairie belt, changing to the north into a zone of poplar interspersed with open prairie, which again gives way to the northern mixed forest covering the northerly parts. The Precambrian rocks just touch Alberta at its northeast corner, so that, excepting the fringe of mountainous country on its western border, practically the whole of the Province is overlain by arable soil of great depth. Alberta has two marked features: (1) the great valley of the Peace River, which has already resulted in the extension of settlement farther north than in any other part of Canada; and (2) the wonderful grazing lands in the foothills district, which, rising sharply on the west, commence the ascent which continues to the very peaks of the Rocky Mountains. The southern half of the Province, rising towards the west, lies at a general elevation of from 2,000 to 4,000 feet; in the northern half, the slope descends until elevations of well under 1,000 feet are reached at Lake Athabaska in the northeast corner. Mount Columbia, with an elevation of 12,294 feet, is the highest point in the Province. Alberta has the most extensive coal resources of any province of the Dominion and has also become the leading producer of petroleum and natural gas. Lumbering is important in the more mountainous western parts and in the north, but ranching is still pursued in the less populous sections. In the southern prairies there are considerable areas where the quantity and distribution of the natural precipitation makes permanent agriculture precarious and in these areas a number of large irrigation projects have been developed, taking their water supply from rivers rising in the mountains which form the western boundary of the Province. The climate of Alberta is a particularly pleasant one, cooler in summer than more eastern parts of the country and tempered in winter by the Chinook winds.

*British Columbia.*—British Columbia, the most westerly province of the Dominion, comprises an area of 366,255 square miles, slightly more than three times the area of the British Isles. The boundaries of the Province extend from Alberta on the east to the Pacific Ocean and Alaska on the west, and from the International

\* See footnote, p. 3.

Boundary northward to Yukon. The predominant feature of the Province is the parallel ranges of mountains which cover all of it except the northeast corner and produce a conformation characterized by high mountain ranges interspaced with valleys many of which are extremely fertile, with climatic conditions well adapted to mixed agriculture or fruit growing. Apart from the smoother area in the northeast corner, which extends up from the "Peace River Block", there is another notably large area of smoother terrain in the Stuart Lake district, traversed by the Canadian National Railway running west from Fort George to Prince Rupert. The highest point in the Province is Mount Fairweather (15,287 feet). The shore line of the Pacific is deeply indented with many inlets ideal for harbourage and with wonderful scenic aspects. With two ocean ports served by transcontinental railways, British Columbia is well situated and equipped to carry on trade with the Orient, and its great stands of fir, spruce, and cedar timber constitute a natural resource of great value. The Province includes many islands of the Pacific, notably the Queen Charlotte group and Vancouver Island; the latter, with an area of about 12,408 square miles, is noted for its temperate climate and abundant natural resources. The wealth of the forest resources supports the lumbering and pulp and paper industries and puts British Columbia ahead of any other province in the production of lumber and timber. The Province also excels in fishery products, chiefly on account of its catches of the famous Pacific salmon. The mineral resources are remarkable for their variety and wealth. The production of the metals, gold, copper, silver, lead, and zinc, has played an important role in the economic life of the Province since its early days, while valuable coal deposits on Vancouver Island, and at Crowsnest and Fernie in the interior, have been worked for many years.

*Yukon Territory.*—Yukon Territory extends from British Columbia on the south to the Arctic Ocean on the north and from the Northwest Territories on the east to Alaska on the west. The meridian of longitude  $141^{\circ}$  W., the western boundary of the Territory, is also the most westerly extent of the Dominion. Its area is 207,076 square miles or slightly more than one-half that of Ontario.

The greater part of the Yukon Territory is mountainous although in the extreme north and southeast the relief is low. The mountainous part is divided into a number of ranges and a central plateau area, all of which exhibit a general northwest trend. The St. Elias Mountains in the southwest are the highest mountains in Canada and, in Mount Logan (19,850 feet elevation), contain the second highest peak in North America. The Coast Mountains lie northeast of the St. Elias Mountains and are followed by the Yukon Plateau, which is bounded on the east and north by the Mackenzie Mountains and their western spur, the Ogilvie Range. The Plateau, which covers most of the southern part of the Territory, is isolated on three sides by mountains through which there is no natural easy route of access; it contains a number of isolated mountain ranges distributed over it, with peaks of 6,000 to 8,000 feet in elevation. Otherwise the higher levels of the Plateau are from 4,000 to 5,000 feet. This plateau area forms the central part of the basin of the Yukon River that drains the central and western parts of the Territory to the Bering Sea, 1,100 miles distant. The territory to the east is drained by the tributaries of the Mackenzie River to the Arctic Ocean; that to the southwest by the Alsek River to the Pacific Ocean. The tributaries of the Yukon River within the plateau area form 1,250 miles of connected waterways, navigable by stern-wheel steamboats. After the discovery of rich deposits of alluvial gold, a railway was built from tidewater at Skagway on the Alaskan coast over the Coast Mountains by

White Pass to Whitehorse, and this railway, with the waterway, has made the Plateau easily accessible.

Dawson, the capital, chief commercial, and placer-mining centre of the Territory, is on the Yukon River and has an elevation of 1,038 feet. Whitehorse, situated at the head of navigation of Lewes River, ranks next in importance, being the junction of rail and water transport and the distributing centre. The elevation at Whitehorse is 2,081 feet above sea-level. Mayo is the centre of the silver-lead mining industry. In recent years roads for use throughout the year have been built in the neighbourhoods of these three places. Aeroplanes are now an important means of travel and a chain of landing fields has been built along the chief air routes.

The chief industries are mining, fur trade, tourist traffic, and big-game hunting: mining is by far the most important. For over fifty years Yukon has been a producer of gold and in more recent years silver, lead, copper, and coal have also been mined in important quantities. A wide variety of other mineral resources have been discovered throughout the Territory, promising greater importance for mining in future. The relatively warm and dry climate for such northern latitudes enjoyed by the Plateau of southern Yukon enables a wide range of garden produce and hardy grains to be grown throughout its extent. The break-up of the ice in the lakes and rivers takes place in May and navigation opens in the fourth week of that month and closes in the latter part of October.

*The Northwest Territories.*—The Northwest Territories consists of the provisional districts of Mackenzie, Keewatin, and Franklin. It embraces all of Canada north of the 60th parallel of latitude and east of the Yukon Territory (including also the islands in Hudson and James Bays and Hudson Strait), except that portion of Quebec which extends north of the 60th parallel. Its area is 1,309,682 square miles, or nearly as large as the combined areas of Argentina and Chile in South America, or over twelve times the area of Great Britain and Northern Ireland.

Much of the area is still unexplored. The highest part of the mainland is in the Mackenzie Mountains, where Keele Peak has an elevation of 8,500 feet and elevations of 11,000 feet have been reported near the headwaters of the South Nahanni River. From the Mackenzie Mountains the land drops to an elevation of less than 500 feet at the Mackenzie River, on the east side of which the Horn and Franklin Mountains reach altitudes of about 2,000 feet. A large depression is formed by a trough-like valley in which Great Bear and Great Slave Lakes are the principal topographical features. To the east of this the land rises to an elevation of 1,400 feet in the great interior plateau, which in turn gradually falls away to the beach-made plains on the west side of Hudson Bay. There are some high mountains in the northeastern Arctic islands, particularly in northern Ellesmere Island where the Shackleton Expedition of 1935 recorded an elevation of 10,000 feet.

Roughly speaking, about one-third of the mainland and all the Arctic islands are treeless. This is not due to inadequate summer temperature, but more likely to insufficient precipitation coupled with the extreme dryness of the air during winter. Some form of plant life is in evidence wherever there is soil. In the wooded areas there is little difficulty in securing forest products sufficient for the needs of the residents.

Photography from the air has assisted in the mapping of areas adjacent to the better-known transportation routes and the areas in which minerals have been discovered. The silver, radium, and copper deposits near the east end of Great Bear Lake, and the gold discoveries in the Yellowknife area north and east of Great Slave

Lake are the most important mineral discoveries. Oil is being refined at the Imperial Oil Company's wells some 42 miles below Norman on the Mackenzie River. Coal has been reported at several points both on the mainland and in the Arctic Archipelago.

Development of the resources of, and communications in, the Northwest Territories and Yukon are dealt with in Chapter XXVIII, Subsection 1 of Section 1.

**Summary of Land and Water Areas.**—The total land and fresh-water areas of the Dominion, together with their distribution by provinces and territories, are shown in Table 1.

**1.—Land and Fresh-Water<sup>1</sup> Areas of Canada, by Provinces and Territories, 1939.**

NOTE.—A classification of land area as agricultural, forested, or unproductive will be found under Part VI of this Chapter at p. 18.

<sup>2</sup> Approximate.

<sup>3</sup> Too small to be enumerated.

**Section 1.—Orography.**

The outstanding and predominant orographical feature in Canada is the great Cordilleran mountain system which, extending up from the south, parallels the coast of the Pacific Ocean, and, continuing on, comprises the bulk of the United States territory of Alaska. Throughout Canada this mountain system has a width of about 400 miles and, covering about 530,000 square miles in area, includes nearly all of British Columbia and Yukon. This region is definitely the most rugged and elevated in the Dominion, many of the summits reaching heights of 10,000 feet with occasional peaks over 13,000 feet above sea-level. The principal named peaks exceeding 11,000 feet in elevation are given in Table 2. The main mountain ranges forming the system are the Coast Mountains and the St. Elias Mountains on the Pacific side, the Selkirks and the Rockies on the east side of the system to the south, and farther north on the east side the Stikine and the Mackenzie Mountains. This great mountainous tract is a formidable barrier between the ocean and the interior of Western Canada; by precipitating a great part of the moisture out of the winds coming from the Pacific, it has a marked effect on the climate of the western country. On the west side, the Cordilleras are drained by mountain streams pitching swiftly down to the Pacific. The Yukon Territory is drained to the north by that remarkable river of the same name which runs through a wide valley over

1,700 miles long before reaching the Bering Sea. On the east side of the mountains and their foothills, the land slopes gently away to the east and to the north.

## 2.—Mountain Peaks over 11,000 Feet in Elevation, by Province and Mountain Range.

NOTE.—The highest point on the mainland of Eastern Canada (peaks of the Torngats in Labrador rise to about 5,500 feet) is Mount Jacques Cartier, a peak of Tabletop Mountain in N. lat. 48° 59', W. long. 65° 56', Gaspé district, Quebec, the summit of which is 4,160 feet above sea-level.

\* Prepared under the direction of F. H. Peters, Surveyor General and Chief, Hydrographic Service, Department of Mines and Resources, Ottawa, from information supplied by the Geodetic Service of Canada.

that any exposure of surface rock is rare. Generally, it is overlain by great depths of clay soil, through which the streams have cut themselves down into deep coulees and the rivers into deep wide valleys. Lakes of any considerable extent are infrequent and usually quite shallow; in the dry prairie section there are many places where the evaporation from the broad and shallow bodies of water is so great that they have little or no outflowage and consequently the concentration of mineral salts in the water makes it unfit for domestic use. The terrain is generally smooth or gently undulating and, from an elevation of 3,400 feet at Calgary, falls away gradually to an elevation of 800 feet around Lake Winnipeg 700 miles to the east. Just north of Edmonton a height of land turns the waters to flow north into the great Mackenzie River, over 2,500 miles long, whose valley with its low elevation above the sea is the outstanding feature of the Northwest Territories. In this watershed the terrain becomes less smooth with prominent elevations in the Caribou, Horn, and Franklin Mountains and the clay soils of the prairies give way to more of sand and gravel. Great Slave and Great Bear Lakes, each half as large again as Lake Ontario and less elevated above the sea than Lake Erie, are notable features; north and east of these two great lakes the country comes within the Canadian Shield\* and the rock with some shallow overburden slopes gently down to the Arctic Ocean without any large uplifts to break the monotony.

Going east again, in the more northerly part there is encountered the orographical influence of Hudson Bay which, indenting the continent so deeply and with rivers running in from west, south, and east, has an enormous drainage basin mainly in Manitoba, Ontario, and Quebec. Practically all of this great basin, excepting the Nelson River drainage, is included in the Canadian Shield, the surface characteristic of which is hard rock either exposed or overlain with shallow soil generally confining agriculture to the valleys or small basins. With only small areas in northeastern Quebec rising above 2,000 feet in elevation, there are no great eminences, but the surface is generally accidented by many hills and hollows with countless numbers of lakes and streams. On its west and south sides, Hudson Bay is bordered by a strip of low land under 500 feet in elevation and varying in width from one hundred to two hundred miles; in the southerly part of these flat, low lands the rock is overlain with a considerable depth of soil sometimes referred to as the clay belt of northern Ontario.

South and east of Hudson Bay the predominating feature, both orographically and economically, is the very extensive depression containing the Great Lakes and the St. Lawrence River which connects them with the Atlantic Ocean. The bulk of the drainage basin of the Great Lakes and the St. Lawrence lies within the limits of the Canadian Shield with the same characteristics as already described. The very important exception is the valley of the St. Lawrence River from Kingston to Quebec and the peninsula of Ontario formed by the Great Lakes which together are generally known as the St. Lawrence Lowlands, about 35,000 square miles in area. Containing as it does the greater part of the population of Canada, this industrial area is of great economic importance; the climatic conditions and fertile soil combine to make it most suitable for mixed farming.

The Maritime Provinces, New Brunswick, Nova Scotia, and Prince Edward Island, together with the southeastern portion of Quebec, embrace an extension

\* Excepting the St. Lawrence Lowlands, the Maritime Provinces, and the Hudson Bay Lowland, the Canadian Shield embraces all of Canada east of a line commencing at Darnley Bay on the Arctic Coast and running south and east through Great Bear Lake, Great Slave Lake, Lake Athabaska, Lake Winnipeg, and Lake of the Woods on the International Boundary.

northward of the Appalachian Mountains but, excepting the Notre Dame Mountains of Gaspé Peninsula, the comparatively low elevations are better described as hills. The whole area may be regarded as a peninsula jutting out with bold and broken coast-line to separate the Gulf of St. Lawrence from the Atlantic and it is this situation that dominates the orography; with the exception of the St. John, the rivers are not of great length in their courses down to the sea. It is a beautiful country of diversified character with areas of good farm lands; the broken coast provides many good harbours and the only ocean ports open throughout the whole year that Canada possesses on the Atlantic seaboard.

## Section 2.—Lakes and Rivers.

The fresh-water area of Canada is unusually large constituting over 6 p.c. of the total area of the country. The outstanding feature is the Great Lakes, details concerning which are given in Table 3.

Particularly notable are the depth of Lake Superior and the shallowness of Lake St. Clair and Lake Erie.

### 3.—Areas, Elevations, and Depths of the Great Lakes.

Lake.	Elevation Above Sea-level.	Length.	Breadth.	Maximum Depth.	Total Area.	Area on Canadian Side of Boundary.
	ft.	miles.	miles.	ft.	sq. miles.	ft.
Superior.....	602·23	383	160	1,302	31,820	11,200
Michigan.....	580·77	321	118	923	22,400	Nil
Huron.....	580·77	247	101	750	23,010	13,675
St. Clair.....	575·30	26	24	23	460	270

Ontario.....	245·88	193	53	774	7,540	3,727

Lake Superior, with an area of 31,820 square miles, is the largest body of fresh water in the world. As the International Boundary between Canada and the United States passes through the waters of Lakes Superior, Huron, St. Clair, Erie, and Ontario, only the parts of the areas of these lakes given in the final column of the above statement are Canadian, while the whole of Lake Michigan is within United States territory. The total length of the St. Lawrence waterway, from the head of the St. Louis River in Minnesota to Pointe-des-Monts at the entrance of the Gulf of St. Lawrence, is 1,900 miles. The great obstacle to navigation on this waterway was the rise of 326 feet between Lakes Ontario and Erie, which is now surmounted by the Welland Ship Canal; the river itself dropping over the escarpment at Niagara creates perhaps the most famous waterfall in the world. The Great Lakes, with the St. Lawrence River, form the most important system of waterways on the continent

and one of the world's most notable fresh-water transportation routes. In addition to the Great Lakes there are many other remarkably large lakes as is shown by Table 4: it will be noted that there are eleven lakes over 1,000 square miles in area. Apart from these lakes, named as notable for their size, there are innumerable other lakes scattered all over that major portion of the area of Canada lying within the Canadian Shield. In an area of 6,094 square miles, accurately mapped, just south and east of Lake Winnipeg, there are 3,000 lakes; in an area of 5,294 square miles, accurately mapped, southwest of Reindeer Lake in Saskatchewan, there are 7,500 lakes. A table at pp. 12-13 of the 1938 Year Book gives a more extended list of the principal lakes of Canada, by provinces, with their elevations in feet and their areas in square miles.

The river systems of Canada, excluding the Arctic islands, are best studied by segregating the main drainage basins as shown in Table 5.\*

<sup>1</sup> Areas are approximate and are exclusive, for all rivers, of those portions of their basins that lie in United States territory.

It is noteworthy that the greater part of the Dominion drains into Hudson Bay and the Arctic Ocean; the Nelson River drainage is exceptional in running *through* the most arable and the most settled part of the West, but, otherwise, the rivers run *away* from the settled areas towards the cold northern salt waters and this adversely affects their industrial utility. The Mackenzie, which drains Great Slave Lake, is, with its headwaters, the longest river in Canada (2,514 miles) and its valley constitutes the natural transportation route through the Northwest Territories down to the Arctic Ocean. From Fort Smith, on the Slave River, large river boats run without any obstruction down to Aklavik in the delta of the Mackenzie, a distance of 1,292 miles. In Eastern Canada it is the Great Lakes and St. Lawrence drainage basin that dominates, and has undergone the greatest degree of development. The St. Lawrence River and the Great Lakes provide a water route from the Atlantic as far as Fort William and Port Arthur, twin cities situated on Lake Superior and only 419 miles from Winnipeg, the half-way mark in distance across the Dominion. The main tributaries of the St. Lawrence all flowing south (most of which have lakes available for reservoiring), together with the main river itself, have developed and undeveloped water powers whose economic value it would be difficult to over-estimate. Apart from the plains region of the West, the rivers of Canada have a vast power potentiality well distributed over the country, as may be seen by reference to the water-power map at the beginning of Chapter XIII. Table 6 shows Canadian rivers and tributaries 300 miles or more in length, by drainage basins. A table at p. 15 of the 1938 Year Book gives a more extended list of the principal rivers with their tributaries classified according to the four major drainage basins.

\* This classification is that of the Dominion Water and Power Bureau, Department of Mines and Resources.

### 6.—Canadian Rivers and Tributaries 300 Miles or More in Length.

NORE.—In this table the tributaries and sub-tributaries are shown by indentation of the names. Thus the Winnipeg River is shown as tributary to the Nelson, and the English River as tributary to the Winnipeg.

### Section 3.—Islands.

The islands of Canada are among its most remarkable geographic features. They include the very large group lying in the Arctic Ocean, the fringe of both large and small islands off the Pacific Coast, those of the Maritime Provinces and Quebec in the Atlantic Ocean and the Gulf of St. Lawrence, together with the islands of the Great Lakes and other inland waters. The Arctic islands are of vast extent, Baffin, Victoria, and Ellesmere, the three largest, being approximately 201,600, 80,450, and 75,024 square miles in area, respectively, but Banks, Devon, Somerset, Prince of Wales, Melville, and Axel Heiberg are each larger than Prince Edward Island; Southampton, another very large island, lies just within the wide mouth of Hudson Bay. Their economic potentialities, have not been fully established, though coal and other minerals exist. The Pacific Coast islands, with the exception of Vancouver Island and the Queen Charlotte group, are small and dot the western coast of British Columbia from Dixon Entrance to the southern boundary of the

Province. Vancouver Island is 285 miles long and from 40 to 80 miles broad, covering an area of about 12,408 square miles; the mountain range which forms its backbone rises again to form the Queen Charlotte Islands farther north. These islands figure largely in the mining, lumbering, and fishing industries of the West, and together with the bold and deeply-indented coast-line provide a region for scenic cruises rivalling those of Norway.

On the eastern coast of the Dominion are the island province of Prince Edward Island, the Islands of Cape Breton (an integral part of Nova Scotia), Anticosti, and the Magdalen group (included in the Province of Quebec), and the Islands of Grand Manan and Campobello (part of the Province of New Brunswick) in the Bay of Fundy. Prince Edward Island is 2,184 square miles in area, Cape Breton 3,970 and Anticosti about the same. Fishing activities in these eastern islands are important, while agriculture on Prince Edward Island and mining on Cape Breton are the chief occupations of the inhabitants.

Manitoulin Island and the Georgian Bay islands in Lake Huron and the Thousand Islands group in the St. Lawrence River, at its outlet from Lake Ontario, are the more important islands of the inland waters.

## PART II.—GEOLOGY.

### Section 1.—Geology of Canada.

An article on this subject, prepared by F. J. Alcock, Ph.D., Mines and Geology Branch, Department of Mines and Resources, Ottawa, appears at pp. 14-25 of the 1939 Year Book.

### Section 2.—Economic Geology.

An article on this subject, prepared by F. J. Alcock, Ph.D., Mines and Geology Branch, Department of Mines and Resources, Ottawa, appears at pp. 16-28 of the 1937 Year Book.

## PART III.—SEISMOLOGY IN CANADA.

An article on this subject, prepared by Ernest A. Hodgson, Ph.D., of the Dominion Observatory, Department of Mines and Resources, appears at pp. 27-30 of the 1938 Year Book.

## PART IV.—THE FLORA OF CANADA.

An article on this subject, together with a bibliography, prepared by John Adams, M.A. (Cantab.), Division of Botany, Experimental Farm, Ottawa, appears at pp. 30-59 of the 1938 Year Book.

## PART V.—FAUNAS OF CANADA.

An article under this heading, by Rudolph M. Anderson, Ph.D., Chief, Division of Biology, Department of Mines and Resources, appears at pp. 29-52 of the 1937 Year Book.

## PART VI.—LANDS, PARKS, SCENIC AND GAME RESOURCES OF CANADA.

Canada is distinctly a new country, and her resources are, for the most part, in the early stages of development. The fur, fishery, and forest resources have, it is true, been the basis of trade for two or three hundred years, but exploitation on the present commercial scale is of relatively recent growth. A notable feature, especially in so young a country, has been the effort directed to conservation and, in the cases of those resources that admit of such methods, the actual replenishment or augmentation of the sources of supply by the practice of reforestation, silviculture, fur farming, or the establishment of fish hatcheries.

Numerous surveys and investigations of the extent and value of the resources have been made and broad outlines of the resources of the provinces supplement the information on physical geography given on pp. 1 to 16. Detailed information regarding individual natural resources will be found in the later chapters—Agriculture, Furs, Fisheries, Forestry, Minerals, Power Generation and Utilization—of this volume.

The treatment of resources considered below is concerned only with those phases of the subject that can be properly regarded as falling under the definition of physiography used in its wider interpretation, and that do not specifically relate to individual subjects, treated elsewhere in this volume. A classification of lands resources, information on the National Parks, and resources in game and scenery properly fall under this head.

**Lands Resources.**—Table 1 presents a broad classification of the potential lands resources of Canada, by provinces. Figures are, in the main, based on estimates of the Dominion Forest Service of the Lands, Parks and Forests Branch, and by the Surveyor General and Chief, Hydrographic and Map Service of the Surveys and Engineering Branch, both of the Department of Mines and Resources; they show how the total land area of Canada is made up as between present and potential agricultural lands, present and potential forest lands, and lands that are unproductive as regards surface resources. Between the totals of present and potential agricultural lands and the totals of forest lands there is, of course, duplication to the extent of the agricultural lands under forest.

# 1.—Land Area of Canada, Classified as Agricultural, Forested, or Unproductive.

NOTE.—The land area of Canada is shown classified by tenure in Chapter XXVIII.

Description.	Prince Edward Island.	Nova Scotia.	New Brun- swick.	Quebec.	Ontario.	Mani- toba.

<sup>1</sup> These totals embrace present agricultural land of all possible classes and land which has agricultural possibilities in any sense. <sup>2</sup> Very small or negligible. <sup>3</sup> Total agricultural land plus forested land, minus forested agricultural land. <sup>4</sup> Includes open muskeg, rock, road allowances, urban land, etc.

<sup>5</sup> An estimate from provincial sources places the total area of land suitable for tillage at 6,626 sq. miles. <sup>6</sup> Revised since the publication of the 1939 Year Book.

**National Parks of Canada.\***—The Dominion Government maintains, as the medium through which regions of outstanding beauty or interest are preserved for all time, the National Parks of Canada. Differing widely in character, and varying in purpose, these areas include: the scenic and recreational parks that extend from the Atlantic Coast to the Rocky and Selkirk Mountains; the national wild-animal parks or preserves—large fenced areas established for the protection and propagation of species once in danger of extinction; and the national historic parks. They are administered by the National Parks Bureau of the Lands, Parks and Forests Branch, Department of Mines and Resources. Under the supervision of this same body are the historic sites of national interest that have been acquired throughout the country. (See pp. 78–90 of the 1938 Year Book.)

In the national parks all wild life is rigidly protected, and primal natural conditions are maintained as far as possible. The local administration of the larger parks is carried out by resident superintendents, assisted by a warden service which is responsible for the necessary game and forest patrols. Opportunities for outdoor life and recreation have been increased by the provision of equipped camp-grounds, bath-houses, and playgrounds, as well as by the construction of golf courses, tennis courts, and outdoor swimming pools. Accommodation is provided in many parks by modern hotels, bungalow camps, and chalets operated by private enterprise. Railways and motor roads serve the parks, and nearly 700 miles of motor highways and 3,000 miles of trails have been built to provide access to the outstanding scenic regions.

The scenic and recreational parks include regions of unsurpassed grandeur in the Rocky and Selkirk Mountains of Western Canada. Among these are: Banff, Jasper, and Waterton Lakes National Parks in Alberta, on the eastern slope of the Rockies; Kootenay and Yoho Parks in British Columbia, on the western slope of the Rockies; and Glacier and Mount Revelstoke Parks (also in British Columbia), in the Selkirks. While these parks bear a general resemblance to one another, each possesses individual characteristics and phenomena, varying fauna and flora, and different types of scenery. Banff Park contains the famous resorts, Banff and Lake Louise, and in Jasper Park is the well-known tourist centre, Jasper. Direct motor-highway connection between these points will be provided by the Banff-Jasper Highway, which is now completed and will be officially opened about July 1, 1940.

Eastward from the mountains are found Prince Albert National Park in Saskatchewan, a typical example of the forest-and-lake country bordering the northwestern plains region, and Riding Mountain National Park in Manitoba, a well-timbered area dotted with numerous lakes, and at a general altitude of 2,000 feet above sea-level. In Ontario are three small park units established primarily as recreational areas. They are Point Pelee, Georgian Bay Islands, and St. Lawrence Islands National Parks.

The most recent additions to Canada's National Park system are in the Maritime Provinces. Cape Breton Highlands National Park, established in 1936, is situated in the northern part of Cape Breton Island. Among its chief attractions are its rugged but picturesque shoreline, and its rolling mountain interior resembling the Highlands of Scotland; these are accessible by the Cabot Trail, a motor road that

---

\* Prepared under the direction of R. A. Gibson, Director, Lands, Parks and Forests Branch, Department of Mines and Resources, Ottawa.

girdles the northern part of the park. Recent developments include highway construction and the provision of facilities for camping and recreation, including a golf course, bath-house, and tennis courts at the administrative headquarters near Ingonish. Prince Edward Island National Park, which extends for 25 miles along the north shore of that province, possesses among its outstanding features miles of magnificent sand beaches, which provide wonderful opportunities for surf-bathing. The park also contains Green Gables, famous in Canadian literature, where recreational facilities, including bath-houses and a golf course, have been constructed. Additional developments have been completed at Dalvay House, the administrative headquarters, and at Brackley Beach, both of which are approximately 14 miles from Charlottetown.

The special animal parks were established for the protection of such species of mammalian wild life as buffalo, elk, and pronghorned antelope, which, once in danger of extinction, now thrive under natural conditions in large fenced enclosures especially suited to their requirements. These reserves include Elk Island National Park in Alberta, 30 miles from Edmonton, which contains a large herd of buffalo and numerous deer, elk, and moose. This park also includes a recreational development at Astotin Lake, where bathing, camping, tennis, and golf may be enjoyed. Nemiskam National Park, also in Alberta, forms a sanctuary for pronghorned antelope.

The national historic parks include Fort Anne, at Annapolis Royal, Nova Scotia, and Fort Beauséjour, near Sackville, New Brunswick, which surround sites notable in early Canadian history. At both of these parks are historical museums housing many exhibits pertaining to the regions in which they are located.

**National Historic Sites.**—The National Parks Bureau is also charged with the preservation, restoration, and marking of historic sites throughout Canada. In the work of acquiring and selecting sites worthy of commemoration, the Bureau has the assistance of the Historic Sites and Monuments Board of Canada, a group of recognized authorities on the history of the section of the country they represent. Of the total number of sites that have been considered by the Board, nearly 300 have been suitably marked by the Department of Mines and Resources and many others recommended for future attention. At a number of the largest and most important sites, historical museums have been constructed or established to house exhibits relating to the region. Such sites include Louisbourg Fortress, Nova Scotia; Forts Lennox and Chambly, Quebec; and Fort Wellington at Prescott, and Fort Malden at Amherstburg, in Ontario.

**Migratory Birds Treaty.**—This Treaty and the legislation making it effective throughout Canada are administered by the National Parks Bureau of the Department of Mines and Resources. The Treaty, which has been effective since 1916, has as its object the protection of the valuable migratory bird life of Canada and the United States. Information concerning the treaty, and regulations enacted for its enforcement, may be obtained from the Controller, National Parks Bureau, Department of Mines and Resources, Ottawa.

## 2.—Locations, Dates Established, Areas, and Characteristics of the National Parks of Canada and Dominion Reserves, 1939.

(Twenty in number with a total area of approximately 29,703 square miles.)

Park.	Location.	Date Estab- lished.	Area.	Characteristics.
			sq. miles.	
<b>Scenic and Recreational Parks.</b>				
Banff.....	Western Alberta, on east slope of Rockies.	1885	2,585.00	Mountain playground containing famous resorts, Banff and Lake Louise. Typical example of central Rockies, with massive ranges, ice-fields, alpine valleys, glacier-fed lakes, and hot mineral springs. Big game sanctuary. Recreations: climbing, motoring, riding, bathing, golf, tennis, fishing, skiing.
Yoho.....	Eastern British Columbia, on west slope of Rockies.	1886	507.00	Rugged scenery on western slope of Rockies. Contains famous Yoho Valley, with its numerous waterfalls; Kicking Horse Valley; Emerald, O'Hara, and Wapta Lakes; natural bridge. Alpine climbing centre.
Glacier.....	Southeastern British Columbia, on the summit of the Selkirk Range.	1886	521.00	Superb example of Selkirk Mountain region, with snow-capped peaks, glaciers, luxuriant forests, alpine flower-gardens, numerous big game. Illecillewaet and Asulkan Glaciers; Rogers Pass; and famed Macdonald tunnel.
Waterton Lakes.....	Southern Alberta, adjoining Glacier Park in Montana, U.S.A.	1895	220.00	Canadian section, Waterton-Glacier International Peace Park. Mountains noted for beauty of colouring; lovely lakes, picturesque trails, waterfalls. Recreations: motoring, riding, fishing, tennis, golf, camping.
Jasper.....	Western Alberta, on east slope of Rockies.	1907	4,200.00	Largest national park in North America, rich in historical associations. Immense region of majestic peaks, deep canyons, beautiful lakes, containing famous resort, Jasper. Also Miette Hot Springs, Maligne Lake, Mount Edith Cavell, and Columbia Ice-field. Big game sanctuary. Recreations: motoring, climbing, riding, bathing, fishing, golf, tennis, skiing.
Mount Revelstoke....	Southeastern British Columbia, on the west slope of Selkirks.	1914	100.00	Alpine plateau on summit of Mount Revelstoke, accessible by spectacular 18-mile drive. Contains mountain lakes, alpine flora, camp-sites. Game sanctuary; winter sports centre.
St. Lawrence Islands.	In St. Lawrence River between Morrisburg and Kingston, Ont.	1914	185.60 (acres)	Mainland reservation and thirteen islands among "Thousand Islands". Recreational area; camping, fishing, bathing.
Point Pelee.....	Southern Ontario, on Lake Erie.	1918	6.04	Most southerly mainland point in Canada (41° 54' N.). Recreational area with unique flora and fine beaches. Resting place for many migratory birds. Bathing, camping.
Kootenay.....	Southeastern British Columbia, on the west slope of Rockies.	1920	587.00	Mountain park bordering Vermilion-Sinclair section of Banff-Windermere Highway. Contains Sinclair Canyon, Radium Hot Springs, Marble Canyon. Big game sanctuary. Recreations: motoring, bathing, camping.
Prince Albert.....	Central Saskatchewan, north of Prince Albert.	1927	1,869.00 (approx.)	Forested lakeland of northwestern Canada, with extensive waterways and fine beaches. Interesting fauna; summer resort. Recreations: boating, bathing, fishing, camping, tennis, golf.

## 2.—Locations, Dates Established, Areas, and Characteristics of the National Parks of Canada and Dominion Reserves, 1939—concluded.

Park.	Location.	Date Established.	Area.	Characteristics.
<b>Scenic and Recreational Parks—conc.</b>			sq. miles.	
Riding Mountain....	Southwestern Manitoba, west of Lake Winnipeg.	1929	1,148.04	Rolling woodland, with crystal lakes, on summit of Manitoba escarpment. Natural home for big game, including elk, deer, moose. Summer resort. Recreations: bathing, boating, fishing, tennis, golf, camping.
Georgian Bay Islands (including Flowerpot Island Reserve)	In Georgian Bay, near Midland, Ont.	1929	5.37	Thirty islands in Georgian Bay. Recreational and camping area; boating, bathing, fishing. Unique limestone formations and caves on Flowerpot Island.
Cape Breton Highlands.	Northern part of Cape Breton Island, Nova Scotia.	1936	390.00 (approx.)	Outstanding example of rugged coastline with mountain background. Remarkable views of Atlantic Ocean and Gulf of St. Lawrence visible from highway, Cabot Trail. Recreations: bathing, boating, golf, tennis, deep-sea fishing, camping.
Prince Edward Island.	North shore of Prince Edward Island.	1937	7.00	Strip 25 miles long on north shore. Recreational area with magnificent beaches. Contains famed Green Gables farmstead. Recreations: bathing, boating, fishing, golf, bowling, camping.
<b>Animal Parks and Reserves.</b>				
Buffalo.....	Eastern Alberta, near Wainwright.	1908	197.50	Fenced area originally set aside for the preservation of buffalo and other big game. Animal population since withdrawn; principal preserve now at Elk Island National Park.
Elk Island.....	Central Alberta, near Lamont.	1911	51.20	Fenced preserve containing a large herd of plains buffalo; also numerous deer, elk, and moose. Recreational area at Asotin Lake; camping, boating, bathing, tennis, and golf.
Nemiskam.....	Southern Alberta, near Foremost.	1922	8.50	Fenced preserve containing a herd of pronghorned antelope, a species native to the region.
Wood Buffalo <sup>1</sup> .....	Partly in Alberta (13,675 sq. miles) and partly in Northwest Territories (3,625 sq. miles), west of Athabaska and Slave Rivers.	1922	17,300.00 (approx.)	Immense unfenced area of forests and open plains, dotted with lakes and coursed by numerous streams and rivers. Contains a large herd of buffalo, including the "woodland" type and also surplus plains buffalo from Buffalo National Park; also bear, beaver, caribou, deer, moose, and waterfowl. Area as yet undeveloped.
<b>Historic Parks.</b>				
Fort Anne.....	Nova Scotia (Annapolis Royal).	1917	31.00 (acres)	Site of early Acadian settlement of Port Royal. Contains well-preserved fortifications of earthworks type; also museum housing a fine historical library and numerous exhibits relating to early periods.
Fort Beauséjour.....	New Brunswick, near Sackville.	1926	59.00 (acres)	Site of French fort erected in middle of 18th century. Renamed Fort Cumberland by British on capture in 1755; original name since restored. Contains museum with many exhibits relating to history of region.

<sup>1</sup> Administered by the Bureau of Northwest Territories and Yukon Affairs of the Lands, Parks and Forests Branch, Department of Mines and Resources, Ottawa.

**Provincial Parks.**—In addition to the national parks throughout Canada administered by the Dominion Government, most of the provinces also maintain provincial parks for the protection of wild life and as recreational areas. Among the largest of these are the Algonquin Park (2,740 square miles) in Ontario, the Laurentides Park (3,565 square miles) in Quebec, and Tweedsmuir Park (approximately 5,400 square miles) in British Columbia.

**Game and Scenery.**—The resources of Canada from the standpoints of the sportsman and tourist are both unique and varied. Owing to the growth of tourist travel and its demands (the statistics of the tourist trade are dealt with in Chapter XVI as a phase of External Trade), great areas of uninhabited land have become accessible, and hitherto almost unknown parts may now be reached and traversed with ease. In the wooded and unsettled areas of every province there are many moose, deer, bear, and smaller game, while in the western parts of the Dominion there are also wapiti, caribou, mountain sheep, mountain goat, grizzly bear, and lynx. Mountain lion, or cougar, are found in British Columbia and in the mountains of Alberta, while in the Northwest and the Far North there still exist herds of buffalo and musk-ox, which, however, are given absolute protection by the Dominion Government.

Ruffed and spruce grouse are found in the wooded areas of Canada from coast to coast. Prairie chicken and Hungarian partridge inhabit the open prairies and the partly timbered areas of the three mid-western provinces. Franklin grouse are native to the mountains of the West and the ptarmigan, an Arctic grouse, lives in the treeless northern plains and is also found in the high mountains of Alberta and British Columbia.

Canada is the natural habitat of many kinds of waterfowl and it is difficult to imagine any finer field for the shot-gun sportsman than is afforded by many of the myriad lakes which form so large a feature of Canadian scenery. This is particularly true of the three mid-western provinces, where the lakes are of the shallow, surface type that furnishes the most abundant feed for waterfowl.

The valleys of Nova Scotia and New Brunswick, the broken lake country of northern Quebec, Ontario, Manitoba, and Saskatchewan, as well as the mountain districts of British Columbia and Alberta, offer to the tourist, the hunter, and the fisherman new scenic effects and innumerable game preserves, and have won for the Dominion a reputation as a paradise for sportsmen and campers. And not only is this possible for those who travel by land; the series of lakes and rivers which form a network over the eastern part of the country particularly, has made water travel in smaller craft both feasible and attractive. Further, facilities for winter sports, the unusual attractions of winter scenery and the bracing though rigorous winter climate, have done much to add to the reputations of resorts formerly noted for their advantages in the summer season. In both Dominion and provincial parks, while angling is permitted, the hunting of game is forbidden, and the wild-life resources preserved. Elsewhere, however, there is available for the hunter, at proper seasons, a wealth of game species.

## PART VII.—CLIMATE AND METEOROLOGY.

### Section 1.—The Climate of Canada.

An article on this subject by Sir Frederick Stupart, at that time Director of the Dominion Meteorological Service, Toronto, appears in the 1929 edition of the Year Book at pp. 42-51.

### Section 2.—The Factors that Control Canadian Weather.

Under the above heading, Sir Frederic Stupart, at that time Director of the Dominion Meteorological Service, Toronto, contributed an article which appears at pp. 26-31 of the 1924 edition of the Year Book, also at pp. 36-40 of the 1925 edition.

### Section 3.—The Distribution of Precipitation in Canada.

An article on "The Distribution of Precipitation in Canada", contributed by A. J. Connor, Climatologist, Dominion Meteorological Office, Toronto, appears at pp. 42-46 of the 1926 edition of the Year Book.

### Section 4.—The Temperature and Precipitation of Northern Canada.

An article on the climate of Northern Canada, accompanied by meteorological tables showing the normal temperature and precipitation at selected northern stations, was contributed by A. J. Connor, of the Meteorological Service of the Department of Marine, Toronto, to the 1930 edition of the Year Book, where it will be found at pp. 41-56.

### Section 5.—The Meteorological Service of Canada.

Under the above heading Sir Frederic Stupart contributed a short article descriptive of the growth and present activities of the Meteorological Service, to the 1922-23 edition of the Year Book (pp. 43-47); to it the interested reader is referred.

### Section 6.—Meteorological Tables.

An article accompanied by tables giving the times of sunrise and sunset for places in certain latitudes across Canada appears at pp. 66-68 of the 1938 Year Book.

### Section 7.—Droughts in Western Canada.

An article on the above subject by A. J. Connor, of the Meteorological Service of the Department of Marine, Toronto, accompanied by diagrams and tables showing the precipitation and sun-spot incidence in the Prairie Provinces, appears at pp. 47-59 of the 1933 edition of the Year Book.

### Section 8.—Standard Time and Time Zones in Canada.

A summary, based on a paper "Standard Time and Time Zones in Canada", by C. C. Smith, Dominion Observatory, Ottawa, accompanied by a map diagram appears at pp. 50-53 of the 1934-35 edition of the Year Book.

# CHAPTER II.—HISTORY AND CHRONOLOGY.

## CONSPECTUS.

	PAGE.		PAGE.
<b>Part I.—History</b> .....	25	<b>SECTION 3. HISTORICAL RECORDS</b> .....	25
SECTION 1. OUTLINES OF CANADIAN HISTORY.....	25	<b>Part II.—Chronology, 1497-1940</b> .....	25
SECTION 2. A BIBLIOGRAPHY OF CANADIAN HISTORY.....	25	SECTION 1. GENERAL CHRONOLOGY....	25
		SECTION 2. SPECIAL WAR CHRONOLOGY.	36

## PART I.—HISTORY.

### Section 1.—Outlines of Canadian History.

The late Sir Arthur Doughty prepared an outline of the history of Canada which appears at pp. 1-29 of the 1913 edition of the Year Book, and in somewhat abridged form at pp. 60-80 of the 1922-23 edition of the Year Book.

A special article, "Canada on Vimy Ridge", prepared by Colonel A. Fortescue Duguid, D.S.O., B.Sc., R.C.A., Director of the Historical Section, Department of National Defence, was published at pp. 50-60 of the 1936 edition of the Year Book.

### Section 2.—A Bibliography of Canadian History.

A Bibliography of Canadian History prepared by Gustave Lanctot, LL.M., D. Litt., LL.D. K.C., F.R.S.C., Deputy Minister, and Dominion Archivist appears at pp. 36-40 of the 1939 edition of the Year Book.

### Section 3.—Historical Records.

A special article, "Historic Sites and Monuments in Canada" was published at pp. 78-90 of the 1938 edition of the Year Book.

A special article, "The Relationship of the Department of Public Archives to the Historical Records of Canada", prepared by Gustave Lanctot, LL.M., D. Litt., LL.D., K.C., F.R.S.C., Deputy Minister, and Dominion Archivist, appears at pp. 33-36 of the 1939 edition of the Year Book.

## PART II.—CHRONOLOGY, 1497 to 1940.

### Section 1.—General Chronology.

- |  |   |
|--|---|
| 1497. June 24, Eastern coast of North America discovered by John Cabot.  | 1541. Cartier's third voyage. He planted wheat, cabbages, turnips, and lettuces near Cap Rouge River.       |
| 1498. Cabot discovered Hudson Strait.  | 1542-3. De Roberval and his party wintered at Cape Rouge, and were rescued by Cartier on his fourth voyage. |
| 1501. Gaspar Corte Real visited Newfoundland and Labrador.   | 1557. Sept. 1, Death of Cartier at St. Malo, France.  |

1632. Mar. 29, Canada and Acadia restored to France by the Treaty of St. Germain-en-Laye.
1633. May 23, Champlain made first Governor of New France.
1634. July 4, Founding of Three Rivers.
- 1634-35. Exploration of the Great Lakes by Nicolet.
1635. Dec. 25, Death of Champlain at Quebec. Founding of the first college at Quebec.
1640. Discovery of Lake Erie by Chaumonot and Brébeuf.
1641. Resident population of New France, 240.
1642. May 17, Founding of Ville-Marie (Montreal) by Maisonneuve.
1646. Exploration of the Saguenay by Dablon.
1647. Lake St. John discovered by de Quen.
1648. Mar. 5, Council of New France created.
1649. Mar. 16-17, Murder of Fathers Brébeuf and Lalemant by Indians and massacre of the Hurons.
1650. Population of New France, 675.
1654. August, Acadia taken by an expedition from New England.
1656. Acadia granted by Cromwell to La Tour, Temple, and Crowne.
1659. June 16, François de Laval arrived in Canada as Vicar-Apostolic.
1660. May 21, Dollard des Ormeaux and sixteen companions killed by Iroquois at the Long Sault, Ottawa River.
1663. Company of 100 Associates dissolved. Feb. 5, severe earthquake. April, Sovereign Council of New France established. Population of New France, 2,500, of whom 800 were in Quebec. Foundation of the "Grand Seminary" at Quebec by Laval.
1664. May, Company of the West Indies founded.
1665. Mar. 23, Talon appointed Intendant.
1666. Feb.-Mar., First census; population of New France, 3,215.
1667. July 21, Acadia restored to France by the Treaty of Breda. Sept.-Oct., Second census; white population of New France, 3,918.
1668. Foundation of the "Little Seminary" at Quebec by Laval. Mission at Sault Ste. Marie founded by Marquette.
1670. May 2, Charter of the Hudson's Bay Company granted.
1671. Population of Acadia, 392.
1672. Population of New France, 6,705. April 6, Comte de Frontenac, Governor.
1673. June 13, Cataraqui (Kingston) founded.
1674. Oct. 1, Laval became first Bishop of Quebec.
1675. Population of New France, 7,832.
1678. Niagara Falls visited by Hennepin.
1679. Ship *Le Griffon* built on Niagara River above the Falls by La Salle. Third census; population of New France, 9,400; of Acadia, 515.
1681. Fourth census; population of New France, 9,677.
1682. Frontenac recalled.
1683. White population of New France, 10,274; settled Indians, 1,512.
1685. First issue of card money. Fifth census; population of New France, 12,515, including 1,538 settled Indians.
1686. Population of New France, 12,566, including 1,436 settled Indians; of Acadia, 894.
1687. Mar. 18, La Salle assassinated.
1688. Sixth census; population of New France, 11,782, including 1,259 settled Indians.
1689. June 7, Frontenac reappointed Governor. Aug. 5, Massacre of whites by Indians at Lachine.
1690. May 21, Sir William Phips captured Port Royal, but was repulsed in an attack on Quebec (Oct. 16-21).

1692. Seventh census; population of New France, 12,431. Oct. 22, Defence of Verchères against Indians by Madeleine de Verchères.
1693. Population of Acadia, 1,018.
1695. Eighth census; population of New France, 13,639, including 853 settled Indians.
1697. Sept. 20, By the Treaty of Ryswick, places taken during King William's War were mutually restored affecting French possessions in America. D'Iberville defeated the Hudson's Bay Company's ships on Hudson Bay.
1698. Nov. 28, Death of Frontenac. Ninth census; population of New France, 15,361.

Dec. 25, H.M. the King broadcasted a Christmas message to the Commonwealth. Dec. 29, Appointment of Canada's first High Commissioners to Ireland (Eire) and New Zealand.

1940. Jan. 1, First municipal government in the Northwest Territories inaugurated at Yellowknife. Jan. 8, Opening of consultations at Ottawa between Canadian and United States Governments on the St. Lawrence Seaway. Jan. 15, First War Loan, 1940, offered to the Canadian public and heavily oversubscribed. Jan. 18, Appointment of Canada's first High Commissioner to the Union of South Africa. Jan. 25, Opening of the fifth session and dissolution of the Eighteenth Parliament. Feb. 11, Death of the Rt. Hon. Baron Tweedsmuir of Elsfield, P.C., G.C.M.G., G.C.V.O. C.H., Governor General and Commander in Chief of the Dominion of Canada, at Montreal, Que. This was the first instance since Confederation of the death of a Governor General while in office. Feb. 12, The Dominion Government ordered seven days of mourning for Lord Tweedsmuir. Feb. 14, State funeral at Ottawa of Lord Tweedsmuir.

NOTE.—For references regarding Dominion Government changes, and Provincial Government changes prior to 1937, see Note on p. 31.

## Section 2.—Special War Chronology.

1939.

Sept. 1, German forces crossed Polish border. General mobilization ordered in United Kingdom. Proclamation issued declaring an apprehended state of war in Canada since Aug. 25.

Sept. 3, Declaration of war by the United Kingdom and France. S.S. *Athenia* torpedoed by German submarine; loss of life 112.

Sept. 4, Royal Air Force successfully attacked German warships in Wilhelmshaven and Brunsbüttel.

Sept. 4-18, Germans advanced into Poland in four drives and, despite heroic resistance, continued their advance until Polish forces were dispersed.

Sept. 6, Poles checked German advance on a line a few miles from Warsaw.

- Sept. 7, First British troops landed in France. Polish fortress of Westerplatte surrendered after a week's siege.
- Sept. 8, Royal Air Force attacked German air bases in the Black Forest and Allied aircraft attacked the Island of Sylt.
- Sept. 9, The Parliament of Canada voted to declare that a state of war existed with Germany.
- Sept. 10, Canada formally proclaimed a state of war with Germany.
- Sept. 11, The Canadian Government prohibited trading with the enemy and custodian of enemy property appointed. Greatest battle of German-Polish War opened on a 250-mile front.
- Sept. 12, Canada's War Budget (See Chap. XXI) passed and plans for a voluntary national registration announced. Poles recaptured Lodz.
- Sept. 13, Prorogation of first War Session of Dominion Parliament.
- Sept. 14, Gdynia surrendered.
- Sept. 15, Formation of Canadian Foreign Exchange Control Board announced. Canadian dealings on the New York Stock Exchange ceased the following day.
- Sept. 16, Przemyśl surrendered.
- Sept. 17, H.M.S. *Courageous* sunk with loss of 518 lives. In a surprise invasion, Russian troops advanced against Poland from the East as Germans continued pressure from the West, South, and North. Polish Government fled to Roumania. Russo-Japanese truce signed.
- Sept. 18, Russian troops penetrated fifty miles into Poland. Vilna occupied and Russian and German forces met at Brest-Litovsk. Meeting of Norwegian, Swedish, Danish, and Finnish premiers to discuss Russian threats to Baltic States. President Roosevelt made a renewed appeal regarding the bombing of civilian populations.
- Sept. 19, Canada announced the preparation of two divisions for overseas service and the doubling of her naval strength. Reorganization of Canadian Cabinet. Russia blockaded the Estonian Coast.
- Sept. 21, Canada and Australia announced large-scale recruiting for the British Air Service. Assassination of Prime Minister Armand Calinescu of Roumania. Completion of French general mobilization.
- Sept. 22, Poland partitioned between Russia and Germany. Belgium and Holland flooded strategic areas as a precaution against German invasion.
- Sept. 25, War Supply Board commenced operations. Heavy artillery of the Maginot line first opened fire on German main defences.
- Sept. 26, The United States, at Panama Conference, proposed a safety zone in American waters.
- Sept. 27, Heavy German attacks on Western Front.
- Sept. 28, Russia offered to open trade negotiations with the United Kingdom.
- Sept. 29, British aeroplanes raided German fleet in Heligoland Bight. Warsaw capitulated. Russia obtained right to build two naval bases on Estonian islands. Under pressure of French advance, Germany ordered complete evacuation of Saar mining regions. Canada announced list of units to form First Division.
- Sept. 30, Royal Air Force aeroplanes flew over and photographed Siegfried line.
- Oct. 1, Polish troops finally surrendered. Premier of Poland announced the raising of a Polish army of 250,000 in Canada and the United States. Russia demanded the Latvian ports of Libau and Windau as trade export harbours.
- Oct. 2, Canadian Order in Council extended the list of articles for which export licences were required, including scrap iron and steel. Pan-American Neutrality Congress at Panama set a neutrality limit of 300 miles around coasts of neutral American nations. United States refused to recognize German-Russian partition of Poland.
- Oct. 3, French claimed to hold 150 square miles of German territory. Russia demanded railway rights to Latvian port of Libau.
- Oct. 5, Russo-Latvian agreement signed, granting Russia naval bases and aerodromes on Latvian territory.
- Oct. 6, Canadian War Supply Board appointed as agent in Canada for British Purchasing Commission. Major-General A. G. L. McNaughton appointed to command First Canadian Division.
- Oct. 7, Canada reported 60,000 recruits had joined C.A.S.F. Herr Hitler proposed peace upon German terms.
- Oct. 8, Russian troops occupied Latvia.
- Oct. 9, Counter-attacks by German forces on Western Front. Soviet troops entered Estonia.

- Oct. 10, France rejected Herr Hitler's peace proposal. Russo-Lithuanian treaty signed.
- Oct. 11, Russo-British agreement for exchange of timber for rubber and tin concluded.
- Oct. 12, Mr. Chamberlain announced that the United Kingdom found it impossible to accept German peace terms. German troops attacked on sixty-mile front without success.
- Oct. 13, Russia made demands upon Finland for naval bases and an agreement for mutual military assistance.
- Oct. 14, H.M.S. *Royal Oak* sunk in Scapa Flow with loss of 786 lives. German submarines commenced sinking Allied merchant ships without warning.
- Oct. 16, First air raid on Rosyth and Forth Bridge. H.M.S. *Southampton*, *Edinburgh*, and *Mohawk* damaged; 17 killed and 45 injured. Four German aeroplanes lost. First Canadian War Loan of \$200,000,000 sold to chartered banks.
- Oct. 17, Mr. Chamberlain announced that one-third of the German submarines in commission at the outbreak of war had been sunk or seriously damaged.
- Oct. 18, Meeting at Stockholm of the Kings of Sweden, Norway, and Denmark and the President of Finland. The United States closed its ports to belligerent submarines.
- Oct. 19, Treaty with United Kingdom and France signed by Turkey, giving Allies access to Black Sea. Germany warned neutrals that any of their ships joining Allied convoys would be sunk without warning.
- Oct. 20, Norway, Sweden, and Finland moved troops to border. Compulsory training reintroduced into Australia.
- Oct. 23, Germany seized United States vessel *City of Flint*.
- Oct. 24, Allied and neutral shipping losses to date were announced as 90 ships, with a tonnage of 399,319 and the loss of 1,774 lives.
- Oct. 26, Germany closed her frontiers abutting on Belgium, Switzerland, and the Netherlands, and cut off her communications to those countries.
- Oct. 27, Encyclical by Pope Pius XII denounced totalitarianism.
- Oct. 28, Canadian delegation to Empire War Conference arrived in London.
- Oct. 29, H.M.C.S. *Assiniboine* taken over from the Royal Navy. Lithuanian troops occupied Vilna.
- Oct. 31, Re-arrangement of Italian Cabinet, pro-German ministers being replaced by neutrals.
- Nov. 1, War Supply Board took over the functions of the Defence Purchasing Board.
- Nov. 3, London announced that total seizures of contraband by the Allies amounted to 560,000 tons, including 12,000,000 gallons of gasoline. Finland answered Russian demands, accepting most but rejecting requests for naval bases.
- Nov. 4, Neutrality Act signed by President Roosevelt, thus releasing war materials consigned to the Allies.
- Nov. 6, Opening of Empire Air Training Conference at Ottawa. Admiralty announced merchant shipping losses as 55 British of 238,793 tons; 7 French of 47,933 tons; and 34 neutrals of 93,823 tons.
- Nov. 7, The British Supply Board announced co-ordination of British war purchases in Canada and the United States, with a prominent Canadian industrialist as Director-General of British war purchases in the United States. The Queen of the Netherlands and the King of the Belgians offered to mediate between the Allies and Germany.
- Nov. 8, Attempt upon the life of Herr Hitler in the Buergerbrau beer cellar in Munich. Work commenced on first Canadian military hospital in England.
- Nov. 9, Germany renewed pressure on Holland and Belgium to ease their strict neutrality.
- Nov. 10, Britain announced the signing of an agreement with Italy to facilitate economic collaboration. Finland reported no basis of discussion reached in Finnish-Russian negotiations.
- Nov. 12, H.M. King George and the President of France replied to the mediation offer of the Queen of the Netherlands and the King of the Belgians, stating that the Allies would not lay down their arms until the fear of repeated German aggression had been banished.
- Nov. 13, Finnish delegation left Moscow.
- Nov. 14, Germany published a list of Allied ships which would be sunk on sight. Germany refused Belgian-Netherlands offer of mediation.
- Nov. 16, Canadian staff arrived in London to open military headquarters.

- Nov. 17, United Kingdom and France agreed to pool their economic as well as their diplomatic and military operations. The British Ministry of Supply announced that it was spending £2,000,000 per day. Germans shot 124 students in Prague and jailed 8,000 persons as a result of anti-German demonstrations.
- Nov. 18, Netherlands liner *Simon Bolivar* and several British and neutral ships sunk by a new pattern of unmoored German mine, with a combined loss of over 150 lives. Further arrests in Bohemia.
- Nov. 21, United Kingdom announced that all exports of German origin or ownership would be seized in retaliation for Germany's use of unmoored and uncharted mines. The Admiralty announced that to date 13 German merchant vessels of a tonnage of 53,244 had been captured and 12, of 53,068 tons, sunk. Argentina introduced a new import policy favouring United Kingdom and France.
- Nov. 23, Hon. C. D. Howe named as ministerial head of the War Supply Board, vice Hon. J. L. Ralston. Admiralty announced that 26 Allied and neutral vessels had been sunk in a week by German mines and submarines. German aeroplanes sowed mines in the Thames Estuary. The Netherlands protested United Kingdom's policy of seizing German exports. British armed merchant cruiser *Ruvalpindi* sunk by German battleship *Deutschland* after an heroic resistance.
- Nov. 24, Hon. J. L. Ralston, Minister of Finance, announced over the radio that the first year of war will cost Canada \$315,000,000. Port of London closed for a few hours due to German mines sown by aeroplanes.
- Nov. 27, Empire air-training scheme completed and sent to the Governments concerned for final approval.
- Nov. 28, Russia denounced the Russo-Finnish non-aggression treaty.
- Nov. 29, Russia broke off diplomatic relations with Finland.
- Nov. 30, Russians invaded Finland. French Chamber of Deputies granted the Government decree powers until the end of the War.
- Dec. 1, Canadian squadron of the R.A.F. formed from Canadians already serving with that Force. Finnish Cabinet resigned in an effort to placate Russia. Helsingfors bombed. Finnish communists set up a 'People's Government' at Terijoki.
- Dec. 2, Sweden further strengthened her forces. Russia recognized the 'People's Government' of Finland.
- Dec. 3, Women and children evacuated from Helsingfors. British aeroplanes attacked German cruisers and destroyers near Heligoland. League of Nations Council convened to consider Russian invasion of Finland.
- Dec. 4, Britain undertook to buy 4,480,000 lb. of Canadian bacon per week. H.M. King George VI arrived in France to visit his troops. Finland commenced to fortify the Aaland Islands. The Finnish Government announced the capture of 1,500 Russians.
- Dec. 6, Finns repulsed Russians on all fronts. Britain sold 30 aeroplanes to Finland.
- Dec. 8, Fascist Grand Council reaffirmed Italy's neutrality. Russo-German commission organized for the mutual exchange of populations between Poland and Germany commenced operations. Russia established a blockade of Finnish ports. Finns reported that they had halted 200,000 Russian troops and had disabled 100 tanks.
- Dec. 9, League of Nations Council met at Geneva.
- Dec. 10, H.M. the King returned from visit to the British troops in France. Italian reports stated that 50 Italian aeroplanes with pilots and ground crews had been sent to Finland. United Kingdom gave Finland facilities for the purchase of military equipment and the United States granted a \$10,000,000 credit for the purchase of civilian supplies.
- Dec. 11, Russian troops reached points from 40 to 60 miles from the border, despite strong Finnish resistance which entailed heavy casualties. Italy's resignation from the League of Nations became effective.
- Dec. 12, Russia rejected a League of Nations proposal to mediate the Russo-Finnish War. United Kingdom and France announced a financial alliance to last until six months after the War.

- Dec. 13, German 'pocket' battleship *Admiral Graf Spee*, while attacking a British convoy off the South American Coast, damaged by British cruisers *Exeter*, *Ajax*, and *Achilles*, and forced to take refuge in Montevideo Harbour.
- Dec. 14, Russia expelled from the League of Nations.
- Dec. 16, Russians claimed to have occupied town of Salmijaervi, the centre of the Finnish nickel-mining area. Uruguay ordered the *Admiral Graf Spee* to sail by Dec. 17 or be interned.
- Dec. 17, First Canadian troops landed in United Kingdom. Empire air-training plan signed in Ottawa by United Kingdom, Canada, Australia, and New Zealand. First British casualties in France announced. *Admiral Graf Spee* blown up by her captain in the mouth of the River Plate.
- Dec. 19, Meeting of the Allied Supreme War Council in Paris and recognition of the Czechoslovak National Committee.
- Dec. 20, New trade agreement between Germany and Roumania doubling oil exports to Germany.
- Dec. 21, Russians retreated in northern sectors of Finnish war area.
- Dec. 22, The Minister of Finance announced the setting up of the National War Loan Committee.
- Dec. 25, Finnish troops drove Russians across the border in the Karelian Isthmus. The 21 American republics protested to United Kingdom, France, and Germany against naval engagements in the American 'neutrality zone'. Pope Pius presented a 5-point peace program.
- Dec. 26, Canadian Shipping Board assumed duties of former Ships Licensing Board.
- Dec. 27, Finns announced that Russians had been forced to retreat over 50 miles in northern Finland, with losses of 4,000 in 3 days. Laying of coast-wise mine belt from Scapa Flow to the Thames announced by British Admiralty. British Indian troops landed in France.
- Dec. 29-30, Finnish troops defeated Russians on the northeastern frontier.
- Dec. 31, Second part of the First Canadian Division landed in the United Kingdom.

(For events in the War Chronology from the beginning of 1940, see Appendix I.)

# CHAPTER III.—CONSTITUTION AND GOVERNMENT.

## CONSPECTUS.

	PAGE.		PAGE
Part I.—Constitution and General Government.....	42	Part IV.—Representatives in Other Countries.....	64

Subsection 4. The House of Commons	50		
Subsection 5. The Dominion Franchise.....	57		
SECTION 2. PROVINCIAL GOVERNMENTS.	58		

The Government of the Dominion of Canada was established under the provisions of the British North America Act of 1867. This Statute of the Imperial Parliament, as from time to time amended, forms the written basis of the Constitution of Canada. Subsequent sections of this chapter describe in some detail the institutions and processes by which Canada is governed.

The several stages in the development of its status as a Dominion have been authoritatively described in the reports of successive Imperial Conferences including that held in London in 1926, which defined the group of self-governing communities consisting of the United Kingdom and the Dominions as "autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any aspect of their domestic or foreign affairs, though united by a common allegiance to the Crown and freely associated as members of the British Commonwealth of Nations". That Conference also recognized that, as a consequence of this equality of status, the Governor General of a Dominion "is the representative of the Crown, holding in all essential respects the same position in relation to the administration of public affairs in the Dominion as is held by His Majesty the King in Great Britain", and that "it is the right of the Government of each Dominion to advise the Crown in all matters relating to its own affairs". Simultaneously, with this change in the constitutional relationship between the several parts of the British Commonwealth of Nations, there developed as a complementary aspect of nationhood the assumption by the several Dominions of further responsibilities and rights of sovereign States in their relations with other members of the community of nations. Membership in the League of Nations, the exercise of treaty-making powers, and the establishment of separate diplomatic representation in a number of foreign countries have characterized this phase in the growth of the Dominion of Canada. More explicit recognition of the implications of the principles of equality of status was accorded in the Statute of Westminster of 1931 which provided for the removal of the remaining limitations on the legislative autonomy of the Dominions.

## **PART I.—CONSTITUTION AND GENERAL GOVERNMENT.**

Under the above heading a brief historical and descriptive account of the evolution of the general government of Canada is given on pp. 89-100 of the Canada Year Book, 1922-23.

## **PART II.—PROVINCIAL AND LOCAL GOVERNMENT.**

Under the heading "Provincial and Local Government in Canada", a brief account of the government of each of the provinces of Canada and of its municipal institutions and judicial organization was published on pp. 101-115 of the 1922-23 edition of the Year Book. The 1938 edition of the Year Book includes at pp. 92-93 an article entitled "The Government of Canada's Arctic Territory".

## **PART III.—LEGISLATIVE AND EXECUTIVE AUTHORITIES.**

### **Section 1.—Dominion Parliament and Ministry.**

The Dominion Parliament is composed of the King (represented by the Governor General), the Senate, and the House of Commons. The Governor General is appointed by the King on the advice of the Government of Canada. Members of the Senate are appointed for life by the Governor General in Council and members of the House of Commons are elected by the people. As a result of the working out of the democratic principle, the part played by the King's Representative and the Upper Chamber of Parliament in the country's legislation has been, in Canada as in the United Kingdom, a steadily decreasing one, the chief responsibilities involved in legislation being assumed by the House of Commons.

In Subsections 3 and 4, pp. 47-57, a brief résumé of the history of parliamentary representation will be found. Attention may be drawn to the growth in the number of members of both the Senate and the House of Commons since Confederation and to the greatly increased unit of representation in the Lower House.

### **Subsection 1.—The Governor General of Canada.**

The Governor General is appointed by the King as his representative in Canada, usually for a term of five years, with a salary fixed at £10,000 sterling per annum, which is a charge against the consolidated revenue of the country. The Governor General is bound by the terms of his commission and can exercise only such authority as is expressly entrusted to him. He acts under the advice of his Ministry, which is responsible to Parliament, and, as the acting head of the Executive, summons, prorogues, and dissolves Parliament, and assents to or reserves bills. In the discharge of these and other executive duties, he acts entirely by and with the advice of his Ministry (the Governor General in Council). The royal prerogative of mercy in capital cases, formerly exercised on the Governor General's own judgment and responsibility, is now exercised pursuant to the advice of the Ministry. The practice whereby the Governor General served as the medium of communication between the Canadian and the British Governments has been given up; since July 1, 1927, direct communication between His Majesty's Government in Canada and His Majesty's Government in the United Kingdom has been instituted.

A list of the Governors General from the time of Confederation, with the dates of their appointment and assumption of office, is given in Table 1.

**1.—Governors General of Canada, 1867-1940.**

Name.	Date of Appointment.	Date of Assumption of Office.
Viscount Monck, G.C.M.G.....	June 1, 1867	July 1, 1867
Lord Lisgar, G.C.M.G.....	Dec. 29, 1868	Feb. 2, 1869
The Earl of Dufferin, K.P., K.C.B., G.C.M.G.....	May 22, 1872	June 25, 1872
The Marquis of Lorne, K.T., G.C.M.G.....	Oct. 5, 1878	Nov. 25, 1878
The Marquis of Lansdowne, G.C.M.G.....	Aug. 18, 1883	Oct. 23, 1883
Lord Stanley of Preston, G.C.B.....	May 1, 1888	June 11, 1888
The Earl of Aberdeen, K.T., G.C.M.G.....	May 22, 1893	Sept. 18, 1893
The Earl of Minto, G.C.M.G.....	July 30, 1898	Nov. 12, 1898
Earl Grey, G.C.M.G.....	Sept. 26, 1904	Dec. 10, 1904
Field Marshal H.R.H. the Duke of Connaught, K.G.....	Mar. 21, 1911	Oct. 13, 1911
The Duke of Devonshire, K.G., G.C.M.G., G.C.V.O.....	Aug. 19, 1916	Nov. 11, 1916
General the Lord Byng of Vimy, G.C.B., G.C.M.G., M.V.O.....	Aug. 2, 1921	Aug. 11, 1921
Viscount Willingdon of Rattou, G.C.S.I., G.C.I.E., G.B.E.....	Aug. 5, 1926	Oct. 2, 1926
The Earl of Bessborough, G.C.M.G.....	Feb. 9, 1931	Apr. 4, 1931
Lord Tweedsmuir of Elsfield, G.C.M.G., G.C.V.O., C.H.....	Aug. 10, 1935	Nov. 2, 1935

**Subsection 2.—The Ministry.**

A system of government based upon the British, by which a Cabinet or Ministry (composed of members of the House of Commons or the Senate), responsible to Parliament, holds office while it enjoys the confidence of the people's representatives, is found in Canada. The Cabinet is actually a committee of the King's Privy Council for Canada. Without enlarging upon the features of the system, it may be sufficient to note that the Cabinet is responsible to the House of Commons, and, following established precedent, resigns office when it becomes evident that it no longer holds the confidence of the people's representatives. Members of the Cabinet are chosen by the Prime Minister; each generally assumes charge of one of the various Departments of Government, although a Minister may hold more than one portfolio at the same time, or may be without portfolio.

The Prime Ministers since Confederation and the dates of their tenures of office, together with the members of the Sixteenth Ministry, are given in Table 2. The complete list of the members of the King's Privy Council for Canada, as at Mar. 15, 1940, is added as Table 3.

## 2.—Ministries since Confederation and Members of the Sixteenth Ministry.

NOTE.—A complete list of the members of Dominion Ministries from Confederation to 1913 appears in the Year Book of 1912, pp. 422-429. A list of the members of Dominion Ministries from 1911 to 1921 appears in the Year Book of 1920, pp. 651-653. A list of the members of the Twelfth and Thirteenth Ministries appears on pp. 76-77 of the 1927-28 Year Book. Members of the Fourteenth Ministry are listed at p. 69 of the 1930 Year Book and members of the Fifteenth Ministry at p. 67 of the 1934-35 Year Book.

1. Rt. Hon. Sir John A. Macdonald, Prime Minister. From July 1, 1867, to Nov. 6, 1873.
2. Hon. Alexander Mackenzie, Prime Minister. From Nov. 7, 1873, to Oct. 16, 1878.
3. Rt. Hon. Sir John A. Macdonald, Prime Minister. From Oct. 17, 1878, to June 6, 1891.
4. Hon. Sir John J. C. Abbott, Prime Minister. From June 16, 1891, to Dec. 5, 1892.
5. Hon. Sir John S. D. Thompson, Prime Minister. From Dec. 5, 1892, to Dec. 12, 1894.
6. Hon. Sir Mackenzie Bowell, Prime Minister. From Dec. 21, 1894, to Apr. 27, 1896.
7. Hon. Sir Charles Tupper, Prime Minister. From May 1, 1896, to July 8, 1896.
8. Rt. Hon. Sir Wilfrid Laurier, Prime Minister. From July 11, 1896, to Oct. 6, 1911.
9. Rt. Hon. Sir Robert L. Borden, Prime Minister. (Conservative Administration.) From Oct. 10, 1911, to Oct. 12, 1917.
10. Rt. Hon. Sir Robert L. Borden, Prime Minister. (Unionist Administration.) From Oct. 12, 1917, to July 10, 1920.
11. Rt. Hon. Arthur Meighen, Prime Minister. (Unionist—"National Liberal and Conservative Party".) From July 10, 1920, to Dec. 29, 1921.
12. Rt. Hon. William Lyon Mackenzie King, Prime Minister. From Dec. 29, 1921, to June 28, 1926.
13. Rt. Hon. Arthur Meighen, Prime Minister. From June 29, 1926, to Sept. 25, 1926.
14. Rt. Hon. William Lyon Mackenzie King, Prime Minister. From Sept. 25, 1926, to Aug. 6, 1930.
15. Rt. Hon. Richard Bedford Bennett, Prime Minister. From Aug. 7, 1930, to Oct. 23, 1935.
16. Rt. Hon. William Lyon Mackenzie King, Prime Minister. From Oct. 23, 1935.

### SIXTEENTH DOMINION MINISTRY.

(According to precedence of the Ministers.)

Office.	Occupant.	Date of Appointment. <sup>1</sup>
Prime Minister, President of the Privy Council, Secretary of State for External Affairs.....	Right Hon. W. L. Mackenzie King, C.M.G.....	Oct. 23, 1935
Member of the Administration and Minister without portfolio.....	Hon. Raoul Dandurand, K.C....	Oct. 23, 1935
Minister of Mines and Resources <sup>2</sup> .....	Hon. Thomas Alexander Crerar.	Oct. 23, 1935
Minister of Justice, Attorney General of Canada, and Acting Secretary of State.....	Right Hon. Ernest Lapointe, K.C.....	Oct. 23, 1935
Minister of Public Works.....	Hon. Pierre Joseph Arthur Cardin, K.C.....	Oct. 23, 1935
Minister of Trade and Commerce.....	Hon. William Daum Euler.....	Oct. 23, 1935
Minister of Finance.....	Hon. James Layton Ralston....	Sept. 6, 1939
Minister of Pensions and National Health.....	Hon. Ian Alistair Mackenzie....	Oct. 23, 1935
Postmaster General.....	Hon. Charles Gavan Power, M.C., K.C.....	Sept. 19, 1939
Minister of National Revenue.....	Hon. James Lorimer Ilsley, K.C.....	Oct. 23, 1935
Minister of Fisheries.....	Hon. Joseph Enoil Michaud, K.C.....	Oct. 23, 1935
Minister of National Defence.....	Hon. Norman McLeod Rogers....	Sept. 19, 1939
Minister of Transport <sup>3</sup> .....	Hon. Clarence Decatur Howe....	Oct. 23, 1935
Minister of Agriculture.....	Hon. James Garfield Gardiner..	Oct. 28, 1935
Minister of Labour.....	Hon. Norman Alexander McLarty.....	Jan. 23, 1939
Minister without portfolio.....	Hon. James Angus MacKinnon...	Sept. 19, 1939
		Jan. 23, 1939

<sup>1</sup> Where two dates are shown, the first indicates the date of first appointment to the present Cabinet and the second the date of appointment to the portfolio held at present.

<sup>2</sup> The Departments of Mines, Interior, Immigration and Colonization, and Indian Affairs were organized into the new Department of Mines and Resources on Dec. 1, 1936.

<sup>3</sup> The Department of Railways and Canals and the Department of Marine, together with the Civil Aviation Branch of the Department of National Defence were organized into the new Department of Transport on Nov. 2, 1936.

### 3.—Members of the King's Privy Council for the Dominion of Canada, According to Seniority Therein,<sup>1</sup> as at Feb. 15, 1940.

NOTE.—In this list the prefix Rt. Hon. indicates membership in the British Privy Council. Besides those mentioned in this list, the Rt. Hon. Sir Lyman P. Duff, G.C.M.G., Chief Justice of the Supreme Court, is a Canadian member of the British Privy Council.

Name.	Date When Sworn In.	Name.	Date When Sworn In.
The Rt. Hon. Sir William Mulock...	July 12, 1896	The Hon. John C. Elliott.....	Mar. 8, 1926
The Rt. Hon. Sir Charles Fitzpatrick <sup>2</sup> ...	Feb. 11, 1902	The Hon. George Burpee Jones....	July 13, 1926
The Hon. Sir A. B. Aylesworth....	Oct. 16, 1905	The Hon. Donald Sutherland.....	July 13, 1926
The Rt. Hon. George P. Graham....	Aug. 30, 1907	The Hon. Raymond Ducharme Morand.....	July 13, 1926

<sup>1</sup> The ordinary legal limit of duration for each Parliament is five years. <sup>2</sup> Adjourned from Dec. 21, 1867, to Mar. 12, 1868, to allow the local legislatures to meet. <sup>3</sup> Period of general elections.

<sup>4</sup> Writs returnable. <sup>5</sup> Dissolution of Parliament. <sup>6</sup> Duration of Parliament in years, months, and days. The life of a Parliament is counted from the date of return of election writs to the date of dissolution, both days inclusive. <sup>7</sup> Not including days (81) of adjournment from May 23 until Aug. 13.

<sup>8</sup> Not including days (59) of adjournment from May 19 to July 18. <sup>9</sup> Not including days (25) of adjournment from Dec. 19, 1912, to Jan. 14, 1913. <sup>10</sup> Not including days (39) of adjournment from Feb. 7 to Mar. 19, 1917. <sup>11</sup> Including days (13) of adjournment from Mar. 3 to Mar. 15. <sup>12</sup> Not including days (54) of adjournment from Dec. 15 to Feb. 8. <sup>13</sup> Not including days (65) of adjournment from Nov. 25 to Jan. 30.

## Subsection 3.—The Senate.

The British North America Act, 1867, provides in Sects. 21 and 22 that "the Senate shall consist of seventy-two members, who shall be styled Senators.\* In relation to the constitution of the Senate, Canada shall be deemed to consist of three divisions—(1) Ontario; (2) Quebec; (3) The Maritime Provinces—Nova Scotia, and New Brunswick; which three divisions shall be equally represented in the Senate as follows: Ontario by twenty-four senators; Quebec by twenty-four senators; and the Maritime Provinces by twenty-four senators, twelve thereof representing New Brunswick and twelve thereof representing Nova Scotia. In the case of Quebec, each of the twenty-four senators representing the province shall be appointed for

\* A senator's sessional indemnity is \$4,000.

one of the electoral divisions of Lower Canada, specified in Schedule A to Chapter I of the Consolidated Statutes of Canada". Further, under Sect. 147 of the same Act, it is provided that "in the case of the admission to Confederation of Newfoundland or Prince Edward Island . . . each shall be entitled to a representation in the Senate of four members. Prince Edward Island, when admitted, shall be deemed to be comprised in the third of the three divisions into which Canada is divided by this Act" and on its admission "the representation of Nova Scotia and New Brunswick shall, as vacancies occur, be reduced from twelve to ten members, respectively". In case of the admission of Newfoundland, the normal membership of the Senate of 72 members was to be increased to 76, while the maximum number of 78 (Sect. 28) was to be 82, Sect. 26 containing a provision for the appointment of three or six additional members in certain cases, to represent equally the three divisions of Canada.

By 33 Vict., c. 3, an Act to establish and provide for the government of the Province of Manitoba, passed in 1870, the newly-formed Province was given representation of two members in the Senate, provision being made at the same time for increases in representation to three and four on increases of population, according to the decennial census, to 50,000 and 75,000, respectively. In the following year, British Columbia, on being admitted to the Union by an Imperial Order in Council of May 16, 1871, was given representation by three senators. Two years later, when Prince Edward Island was admitted to Confederation by an Imperial Order in Council of June 26, 1873, it was granted representation in the Senate of four members under the terms of the British North America Act, as cited above. Thus, in 1873, the seven provinces—Ontario, Quebec, Nova Scotia, New Brunswick, Manitoba, British Columbia, and Prince Edward Island—were represented by a total of 77 members in the Senate, their individual representation at the time being 24, 24, 10, 10, 2, 3, and 4 members, respectively.

In 1882, following the Census of 1881 and an increase of population in Manitoba to 62,260 persons, the representation of this Province was increased to three members under authority of the Manitoba Act, 1870. Later, by 50-51 Vict., c. 38, an Act of 1887, the representation of the Northwest Territories in the Senate was fixed at two members. A subsequent increase resulted from the growth of population in Manitoba to 152,506, as shown by the Census of 1891, the Province being granted a fourth senator under the terms of the Manitoba Act of 1870. An Act passed in the session of 1903 (3 Edw. VII, c. 42) provided for an increase in the representation of the Northwest Territories from two to four members, bringing the total representation at this date to 83 members.

On the establishment of the Provinces of Alberta and Saskatchewan out of the former Northwest Territories in 1905, under 4-5 Edw. VII, cc. 3 and 42, provision was made for their representation in the Senate by 4 members each, which might be increased by Parliament to 6 on the completion of the next decennial census. This change in representation brought the membership of the Upper Chamber to a total of 87.

In 1915, by an amendment to the British North America Act (5-6 Geo. V, c. 45), an important change was made with regard to the constitution of the Senate. The number of divisions provided for by Sect. 22 of the original Act was increased from three to four, the fourth comprising the four western provinces of Manitoba, Saskatchewan, Alberta, and British Columbia. Each of these Provinces was to be represented by 6 members under the Act, the division being thus represented by 24 members and placed on an equality with the others with respect to membership.

A corresponding change was made in the number of additional senators provided for by the original British North America Act by substituting increases of four or eight members for the three or six cited in Sect. 26 of the Act of 1867. Normal representation, therefore, is at present fixed at 96, which number may be increased if necessary to 100 or to a maximum of 104.

The entry of Newfoundland to the Union is still provided for by the above Act; s-s 6 of Sect. 1 would allow it a representation of 6 members instead of the 4 granted by the Act of 1867. If Newfoundland were admitted to the Dominion, the normal number of senators would, therefore, be 102 with a maximum of 110.

In Table 5 the growth of membership in the Senate is shown by divisions and provinces from 1867 to 1915, since when no change has taken place. The names and addresses of the senators from each province are given, as at Mar. 15, 1940, in Table 6.

**Subsection 4.—The House of Commons.**

In Sect. 37 of the original British North America Act of 1867 (30 Vict., c. 3), it is provided that "The House of Commons shall...consist of one hundred and eighty-one members, of whom eighty-two shall be elected for Ontario, sixty-five for Quebec, nineteen for Nova Scotia and fifteen for New Brunswick".\* Further, under Sect. 51, it is enacted that after the completion of the Census of 1871 and of each subsequent decennial census, the representation of the four provinces should be readjusted by such authority, in such manner, and from such time, as the Parliament of Canada provided, subject to and according to the following rules:—

- "(1) Quebec shall have the fixed number of Sixty-five Members;
- "(2) There shall be assigned to each of the other Provinces such a Number of Members as will bear the same Proportion to the Number of its Population (ascertained at such Census) as the Number Sixty-five bears to the Number of the Population of Quebec (so ascertained);
- "(3) In the Computation of the Number of Members for a Province a fractional Part not exceeding One Half of the whole Number requisite for entitling the Province to a Member shall be disregarded; but a fractional Part exceeding One Half of that Number shall be equivalent to the whole Number;

\* The sessional indemnity of a member of the House of Commons is \$4,000.

“(4) On any such Re-adjustment the Number of Members for a Province shall not be reduced unless the Proportion which the Number of the Population of the Province bore to the Number of the aggregate Population of Canada at the then last preceding Re-adjustment of the Number of Members for the Province is ascertained at the then latest Census to be diminished by One Twentieth Part or upwards;

“(5) Such Re-adjustment shall not take effect until the Termination of the then existing Parliament.”

Again, in Sect. 52, it is enacted that “the number of members of the House of Commons may be from time to time increased by the Parliament of Canada, provided the proportionate representation of the Provinces prescribed by this Act is not thereby disturbed”.

Later on, by the British North America Act of 1886 (49-50 Vict., c. 35), provision was made in Sect. 1 that “the Parliament of Canada may from time to time make provision for the representation in the Senate and House of Commons of Canada, or in either of them, of any territories which for the time being form part of the Dominion of Canada, but are not included in any province thereof”.

Again in 1915, an amendment to the British North America Act (5-6 Geo. V, c. 45) was passed by the Imperial Parliament, providing that “notwithstanding anything in the said Act, a province shall always be entitled to a number of members in the House of Commons not less than the number of senators representing such province”.

**Readjustments in Representation.**—As set out in the above-mentioned provisions of the British North America Act, the representation in the House of Commons has been readjusted following each of the seven decennial censuses since taken, also as a result of the admission of Manitoba, British Columbia, and Prince Edward Island to Confederation and the creation of portions of the Northwest into Saskatchewan, Alberta, and Yukon. At pp. 74-77 of the 1934-35 Year Book, the problems of redistribution are dealt with in detail, especially those arising out of the 1931 Census. Summarized accounts are also carried in later Year Books down to 1937 (see pp. 79 and 80 of the 1937 Year Book).

The number of representatives of each province elected at each of the eighteen general elections since Confederation is given in Table 7.

**7.—Representation in the House of Commons as at Dominion General Elections, 1867-1935.**

<sup>1</sup> The representation at the general elections of 1926 and 1930 was the same as in 1925.

**The Unit of Representation.**—While the number of members of the House of Commons has been growing fairly steadily since Confederation, the unit of representation—one sixty-fifth of the population of Quebec as taken at each census

within its 1911 boundaries—has also been increased after each census in consequence of the growth of the population of Quebec. The units of representation, as determined by the decennial censuses taken since Confederation, are as follows: 1871, 18,331 persons; 1881, 20,908; 1891, 22,901; 1901, 25,368; 1911, 30,819; 1921, 36,283; 1931, 44,186, being one sixty-fifth of the population of Quebec exclusive of Ungava.

### Constituencies and Representatives in the Eighteenth Parliament.—

A complete list of the constituencies, with their 1931 populations, the voters on the list and votes polled at the general election of Oct. 14, 1935, together with the names and addresses of those then elected to the House of Commons of the eighteenth Parliament of Canada, will be found in Table 8. Changes occurring at subsequent by-elections to Jan. 25, 1940, the date of dissolution, are indicated in the footnotes.

### 8.—Electoral Districts, Voters on List and Votes Polled, Names and Addresses of Members of the House of Commons as Elected at the Eighteenth General Election, Oct. 14, 1935.

NOTE.—A list of new Members as elected at the Dominion election Mar. 26, 1940, is given in Appendix III.

**Subsection 5.—The Dominion Franchise.**

An article by Col. J. T. C. Thompson, Dominion Franchise Commissioner, appears at pp. 86-88 of the 1937 edition of the Year Book. Briefly, the qualifications for the Dominion franchise are that one must be a British subject, of the full age of 21 years, and have been ordinarily resident in Canada for at least one year, and resident for three months in the electoral district in which application is being made for registration.

**The Use of the Franchise.**—The numbers of voters on the lists and the numbers of votes polled at the general elections of 1925, 1926, 1930, and 1935 are given in Table 9.

<sup>1</sup> Each voter in the double-member constituency of Queens County, P.E.I., had two votes; in 1935, 23,467 voters on the list cast 37,576 votes. <sup>2</sup> Each voter in the double-member constituency of Halifax, N.S., had two votes; in 1935, 60,593 voters on the list cast 85,986 votes. <sup>3</sup> Each voter in the double-member constituency of St. John-Albert, N.B., had two votes; in 1930, 37,067 voters on the list cast 50,121 votes.

<sup>4</sup> Not including one electoral district in which the return was by acclamation. <sup>5</sup> Each voter in the double-member constituency of Ottawa, Ont., had two votes; in 1930, 61,535 voters on the list cast 97,369 votes. <sup>6</sup> Not including two electoral districts in which the returns were by acclamation.

## Section 2.—Provincial Governments.

Table 10 gives the names and areas, as in 1940, of the several provinces, territories, and provisional districts of the Dominion, together with the dates of their creation or admission into the Confederation and the legislative process by which this was effected.

### 10.—Provinces and Territories of Canada, with Present Areas, Dates of Admission to Confederation, and Legislative Process by which Admission was Effected.

Province, Territory, or District.	Date of Admission or Creation.	Legislative Process.	Present Area (square miles).		
			Land.	Fresh Water.	Total.

			546,532	7,500	554,032
Totals.....			3,466,556	228,307	3,694,863

<sup>1</sup> The area of Ontario was extended by the Ontario Boundaries Extension Act, 1912 (2 Geo. V, c. 40).

<sup>2</sup> Extended by Quebec Boundaries Extension Act, 1912 (2 Geo. V, c. 45), and diminished in consequence of the award of the Judicial Committee of the British Privy Council (Mar. 1, 1927), whereby some 112,400 square miles of territory, formerly considered as part of Quebec, were assigned to Newfoundland.

<sup>3</sup> Extended by Extension of Boundaries of Manitoba Act, 1881, and Manitoba Boundaries Extension Act, 1912 (2 Geo. V, c. 32).

<sup>4</sup> Too small to be enumerated. <sup>5</sup> Alberta and Saskatchewan now cover approximately the area formerly comprised in the districts of Assiniboia, Athabaska, Alberta, and Saskatchewan, established May 17, 1882, by minute of Canadian P.C., concurred in by Dominion Parliament and Order in Council of Oct. 2, 1895.

<sup>6</sup> By Order in Council, June 23, 1870, Rupert's Land, acquired under the Rupert's Land Acts of 1867 and 1868, and the undefined Northern Territories were admitted into the Confederation. The original Northwest Territories, mentioned in the Manitoba Act, 1870, were established by the Northwest Territories Act, 1880 (43 Vict., c. 25), the district of Keewatin having been previously defined by an Act of the Dominion Parliament (39 Vict., c. 21). The provisional districts of Yukon, Mackenzie, Franklin, and Ungava were defined in an Order in Council of Oct. 2, 1895, their boundaries being changed by Order in Council of Dec. 18, 1897. By Order in Council of July 24, 1905, the area of Keewatin, not included in the Northwest Territories, was annexed to the latter from Sept. 1, 1905. By the Extension of Boundaries Act, 1912, Ungava was made a part of the Province of Quebec, and the remaining area of the Northwest Territories south of 60° N. latitude was divided between Manitoba and Ontario.

In each of the provinces the King is represented by a Lieutenant-Governor appointed by the Governor General in Council and governs with the advice and assistance of his Ministry or Executive Council, which is responsible to the Legislature and resigns office when it ceases to enjoy the confidence of that body. The Legislatures of all the provinces with the exception of Quebec are now unicameral, consisting of a Legislative Assembly elected by the people. In Quebec there is a Legislative Council as well as a Legislative Assembly. For detailed description of the Provincial Governments, the reader is referred to pp. 101-115 of the 1922-23 edition of the Year Book.

**11.—Lieutenant-Governors of Provinces, 1867-1940, and Present Ministries.**

NOTE.—The Lieutenant-Governor of a province is styled "His Honour" and is also styled "Honourable" throughout his life. Legislatures and Ministries from Confederation to 1923 will be found on pp. 75-84 of the 1924 Year Book, and for 1924-37 at pp. 110-118 of the 1938 Year Book.

(Three members elected 1937, for 3 years.)

Dawson District.....John A. McDonald, Granville.  
 Whitehorse District.....G. W. Wilson, Whitehorse.  
 Mayo District.....Ernest J. Corp, Keno.

**11.—Lieutenant-Governors of Provinces, 1867-1940, and Present Ministries—concluded.****THE NORTHWEST TERRITORIES.**

NOTE.—In 1888 the districts of Alberta, Assiniboia, Athabaska, and Saskatchewan, then called the Northwest Territories, with their capital at Regina, were given local responsible government, and the old Northwest Council was replaced by the Northwest Legislature, which existed until Aug. 31, 1905. When the area included in these districts was formed into the Provinces of Alberta and Saskatchewan, on Sept. 1, 1905, these Provinces were given systems of government similar to the other provinces of the Dominion. The resources of the remaining areas (Yukon and the Provisional Districts of Franklin, Keewatin, and Mackenzie) are now administered by the Lands, Parks and Forests Branch, Department of Mines and Resources.

<sup>1</sup> Second term.

**TERRITORIAL COUNCIL.**

(Appointed by the Governor General in Council.)

Commissioner—Charles Camsell, C.M.G., LL.D., F.R.S.C.

Deputy Commissioner—Roy Alexander Gibson.

Members of the Council—Austin Louis Cumming; Kenneth Robinson Daly; Howard Wigmore McGill, M.C., M.D.; Oscar Douglas Skelton, C.M.G., M.A., Ph.D., LL.D.; Brigadier Stuart Taylor Wood.

Secretary—David Livingstone McKeand.

**PART IV.—REPRESENTATIVES OF CANADA IN OTHER COUNTRIES.\*****Section 1.—High Commissioners Within the British Commonwealth of Nations.**

**United Kingdom.**—The present High Commissioner for Canada in the United Kingdom is the HON. VINCENT MASSEY, who was appointed on Nov. 8, 1935. His office is in Canada House, Trafalgar Square, London, S.W. 1.

Following is the list of previous High Commissioners:—

SIR ALEXANDER GALT, 1880-83

SIR CHARLES TUPPER, 1884-87, 1888-96

LORD STRATHCONA AND MOUNT ROYAL, 1896-1914

SIR GEORGE PERLEY, 1917-22, (Acting High Commissioner 1914-17)

THE HON. P. C. LARKIN, 1922-30

THE HON. G. HOWARD FERGUSON, 1930-35

\* Revised by the Department of External Affairs, Ottawa. An annual report on the organization and activities of Canadian Government representation abroad is contained in the Report of the Department of External Affairs, which may be obtained from the King's Printer, price 25 cents.

**Australia.**—The present and first High Commissioner for Canada in Australia is MR. CHARLES J. BURCHELL, who was appointed on Nov. 1, 1939. His office is in Canberra.

**New Zealand.**—The present and first High Commissioner for Canada in New Zealand is DR. W. A. RIDDELL, who was appointed on Feb. 1, 1940. His office is in Wellington.

**South Africa.**—The present and first High Commissioner for Canada in the Union of South Africa is DR. HENRY LAUREYS, who was appointed on Feb. 1, 1940. His office is in Pretoria.

**Ireland.**—The present and first High Commissioner for Canada in Ireland is MR. JOHN HALL KELLY, who was appointed on Feb. 1, 1940. His office is in Dublin.

## Section 2.—Diplomatic Representatives in Foreign Countries.

**United States of America.**—The present Canadian Minister to the United States is MR. LORING C. CHRISTIE, who presented his credentials on Sept. 25, 1939. The address of the Canadian Legation is 1746 Massachusetts Avenue, Washington, D.C.

Following is the list of previous Ministers:—

THE HON. VINCENT MASSEY, 1927-30

THE HON. W. D. HERRIDGE, 1931-35

THE HON. SIR HERBERT MARLER, 1936-39

**France.**—The present Canadian Minister to France is LT.-COL. GEORGE P. VANIER, who presented his credentials on Feb. 13, 1939. The address of the Canadian Legation is 1, rue François premier, Paris.

His predecessor, the first Canadian Minister to France, was the HON. PHILIPPE ROY, who served from 1928 until 1938.

Until his appointment as Minister, Mr. Roy was Commissioner General for Canada in France from 1911. From 1882 until 1911, the Canadian Government maintained an agency in Paris, the post being held by the HON. HECTOR FABRE.

**Japan.**—The post of Canadian Minister to Japan is vacant. The Chargé d'Affaires of the Canadian Legation is MR. E. D. MCGREER. The Legation is at 16 Omote-Cho, Sanchome, Akasaka-ku, Tokyo.

Following is the list of previous Ministers:—

THE HON. SIR HERBERT MARLER, 1929-36

THE HON. R. RANDOLPH BRUCE, 1936-38

**Belgium.**—The present and first Canadian Minister to Belgium is MR. JEAN DESY, who presented his credentials on Feb. 4, 1939. The Canadian Legation is at 176 Avenue Brugmann, Brussels.

**Netherlands.**—The present and first Canadian Minister to the Netherlands is MR. JEAN DESY, who presented his credentials on Feb. 24, 1939. The Canadian Legation is at 61 Nieuwe Parklaan, The Hague.

**League of Nations.**—The Permanent Delegate of Canada to the League of Nations is MR. H. H. WRONG.

Canada's first permanent representative at Geneva accredited to the League was DR. W. A. RIDDELL, who was appointed in 1925 with the title of Canadian Advisory Officer. He was succeeded in 1937 by Mr. Wrong, and on Apr. 1, 1938, the title of the position was changed to Permanent Delegate of Canada to the League of Nations. The office of the Permanent Delegate is at 41 Quai Wilson, Geneva.

## PART V.—REPRESENTATIVES OF OTHER COUNTRIES IN CANADA.

### Section 1.—Representatives of Members of the British Commonwealth of Nations.

**High Commissioner for the United Kingdom:** (Office established 1928.)

*Address:* Earnsliffe, Ottawa.

The present High Commissioner is SIR GERALD CAMPBELL, who assumed office in October, 1938. The previous High Commissioners were:—

SIR W. H. CLARK, 1928-34

SIR FRANCIS FLOUD, 1935-38

**High Commissioner for the Commonwealth of Australia:** (Office established 1939.)

*Address:* Ottawa.

The present and first High Commissioner is MAJOR GENERAL THE HON. SIR THOMAS W. GLASGOW, who assumed office in 1940.

**Accredited Representative of the Union of South Africa:** (Office established 1938.)

*Address:* 56 Sparks Street, Ottawa.

The present and first Accredited Representative is MR. DAVID DE WAAL MEYER, who assumed office in April, 1938.

**High Commissioner for Ireland:** (Office established 1939.)

*Address:* 140 Wellington Street, Ottawa.

The present and first High Commissioner is MR. JOHN J. HEARNE, who assumed office in August, 1939.

## Section 2.—Diplomatic Representatives of Foreign Countries.

**Legation of the United States of America:** (Established 1927.)

*Address:* Wellington Street, Ottawa. *Envoy Extraordinary and Minister Plenipotentiary:* THE HON. JAMES H. R. CROMWELL.

**Legation of France:** (Established 1928.)

*Address:* 42 Sussex Street, Ottawa. *Envoy Extraordinary and Minister Plenipotentiary:* COUNT ROBERT DE DAMPIERRE.

**Legation of Japan:** (Established 1928.)

*Address:* 140 Wellington Street, Ottawa. *Envoy Extraordinary and Minister Plenipotentiary:* BARON TOMII.

**Legation of Belgium:** (Established 1937.)

*Address:* Stadacona Hall, 395 Laurier Avenue East, Ottawa. *Envoy Extraordinary and Minister Plenipotentiary:* BARON SILVERCRUYS.

**Legation of the Netherlands:** (Established 1939.)

*Address:* 18 Range Road, Ottawa. *Envoy Extraordinary and Minister Plenipotentiary:* MR. F. E. H. GROENMAN.

## PART VI.—CANADA AND THE LEAGUE OF NATIONS.\*

**General.**—The League of Nations is an association of self-governing States whose relations are governed by the Covenant. The League of Nations acts through an Assembly and a Council composed of representatives of Governments. Fifty-one States are (at January, 1940) Members of the League, as compared with forty-two at the time of the First Assembly in 1920. Canada, as a signatory of the Treaties of Peace, is an original Member of the League.

**The Organs of the League.**—The organs of the League are:—

- (1) The Assembly
- (2) The Council
- (3) The Secretariat

*The Assembly.*—The Assembly consists of representatives of the Members of the League. The annual ordinary session of the Assembly, which should have taken place in September, 1939, was held in December, 1939.

*The Council.*—The Council, which originally consisted of five permanent members and four non-permanent members now consists of two permanent members, (the United Kingdom and France), and eleven non-permanent members. The non-permanent members at January, 1940, were Belgium, Iran, Peru, Yugoslavia, Dominican Republic, Greece, Union of South Africa, Finland, Bolivia, Egypt, and China. Canada was a member of the Council from 1927 to 1930.

\* The League of Nations Society in Canada, 124 Wellington Street, Ottawa, is the authorized agent for the publications of the League of Nations.

*The Secretariat.*—The Permanent Secretariat is the Civil Service of the League. The staff is appointed by the Secretary General with the approval of the Council. The officials of the Secretariat of the League are exclusively international officials, having international and not national duties. The First Secretary General, Sir Eric Drummond, who was named in the Annex to the Covenant, resigned in 1933 and was succeeded by M. Joseph Avenol.

**The International Labour Organization.**—(See Chapter XIX.)

**The Permanent Court of International Justice.**—The Permanent Court of International Justice was established by the Protocol of Dec. 16, 1920, in accordance with Article 14 of the Covenant of the League of Nations. It is composed of a body of fifteen judges elected by the Assembly and Council of the League of Nations for a term of nine years, and sits at The Hague. The Court is competent to hear and determine any dispute of an international character that the parties thereto submit to it; it may also give an advisory opinion upon any dispute or question referred to it by the Council or the Assembly. Canada has been a member of the Court from its establishment.

**Membership of the League of Nations.**—The States that are members of the League (January, 1940) are as follows:—

Afghanistan	Estonia	Norway
Union of South Africa	Ethiopia	Panama
Albania <sup>1</sup>	Finland	Peru <sup>1</sup>
Argentine Republic	France	Poland
Australia	Greece	Portugal
Belgium	Haiti	Roumania
Bolivia	Hungary <sup>1</sup>	Siam
Bulgaria	India	Spain <sup>1</sup>
Canada	Iran	Sweden
Chile <sup>1</sup>	Iraq	Switzerland
China	Ireland (Eire)	Turkey
Colombia	Latvia	United Kingdom of Great
Cuba	Liberia	Britain and Northern
Czechoslovakia	Lithuania	Ireland
Denmark	Luxemburg	Uruguay
Dominican Republic	Mexico	Venezuela <sup>1</sup>
Ecuador	Netherlands	Yugoslavia
Egypt	New Zealand	

<sup>1</sup> Chile, on June 2, 1938, gave notice of her intention to withdraw from the League. Venezuela gave such notice on July 11, 1938; Peru on Apr. 8, 1939; Hungary on Apr. 11, 1939; Albania on Apr. 13, 1939; and Spain on May 8, 1939. The notices cannot take effect until two years after they are given.

SECTION 10. RURAL AND URBAN POPULATION.....	92		

The Population chapter of the Year Book is a *précis* of the results of investigations into the number and the constitution of the population made in the seven censuses of Canada since Confederation, summarizing the growth and distribution of population between 1871 and 1931, as shown by the successive decennial censuses, in regard to the chief matters investigated at the censuses. Owing to the extent of the field covered, it is quite impossible to include in each edition of the Year Book a full digest of population statistics. The policy adopted, therefore, is to maintain the skeleton of the chapter and the historical tables as a permanent feature and build up each section as statistics are available following each census. After complete and accurate summary statistics have been given publicity, the chapter is cut down to skeleton limits, with adequate references, until the next census. The 1934-35 Year Book gives at pp. 98-169 as complete a picture of the 1931 Census statistics as will appear in one Year Book.

Under the Canadian constitution, the legal *raison d'être* of the census is to determine representation in the House of Commons; after each decennial census a redistribution of seats in the House, following the course of the movement of population, is made in the manner described on pp. 50-52 of this volume. But the census, especially since the introduction of methods of mechanical tabulation, has become far more than a mere counting of heads. It is a great periodical stock-taking of the people and their affairs, designed to show as fully as possible the stage that has been reached in the progress of the nation. Thus the numbers, local distribution, age, sex, racial origin, nationality, language, religion, education, housing, and occupations of the people, severally, constitute investigations of enormous importance, to which all the continuous and routine statistics collected in the ordinary course of administration must be related if their full value is to be realized. The census, in fine, rounds out and completes the scheme of information upon which the Government relies in conducting the business of the country.

---

\* This chapter has been revised by A. J. Pelletier, F.S.S., Chief, Demography Branch, Dominion Bureau of Statistics. A list of the publications of this Branch will be found in Chapter XXIX, Section 1, under "Population".

On account of the requirements as to parliamentary representation and the payment of provincial subsidies, which are based on population, the Canadian census is taken on the *de jure* principle, i.e., each person is counted as belonging to the locality in which he is regularly domiciled, irrespective of where he may be at the date of the enumeration. Under the *de facto* method, adopted in the United Kingdom, each individual is counted as belonging to the locality where he is found on the census date. The *de facto* method is undoubtedly simpler, but the *de jure* plan better portrays the permanent condition of the population. The chief difficulty in the application of the latter method is found in connection with holiday resorts, in the segregation of "visitors" and the tracing of "absentees". A date prior to the opening of the holiday season is accordingly chosen for the date of the census. In the Canadian census, students and inmates of hospitals are assigned to their home localities, while inmates of prisons, gaols, lunatic asylums, etc., are counted where found.

### Section 1.—Census Statistics of General Population.

Since the creation of the Dominion of Canada, in 1867, decennial censuses have been taken on the *de jure* plan as of the dates April 2, 1871, April 4, 1881, April 5, 1891, April 1, 1901, June 1, 1911, 1921, and 1931. The population of Canada and its percentage distribution as on each date, together with the absolute and percentage increases from decade to decade, are given in Tables 1 to 4 immediately following. The population is given by counties or census divisions on pp. 103-107 of the 1934-35 Year Book and corresponding areas and densities of population for 1931 on pp. 109-110 of the same edition.

#### 1.—Population of Canada, by Provinces and Territories, Census Years 1871 to 1931

NOTE.—The population of the Prairie Provinces in 1906, 1916, 1926, and 1936, is shown on p. 147 of the 1937 Year Book. For intercensal estimated populations, see table on p. 103.

**Early Censuses.**—The credit of taking the first census of modern times belongs to Canada; the year was 1666, the census that of the colony of New France. Still earlier records of settlement at Port Royal (1605) and Quebec (1608) are extant; but the Census of 1666 was a systematic 'nominal' enumeration of the people, taken on the *de jure* principle on a fixed date, showing age, sex, occupation, and conjugal and family condition. A second census in 1667 included the areas under cultivation and the numbers of sheep and cattle. When it is recalled that in Europe the first census dates only from the eighteenth century (those of France and England from the first year of the nineteenth) and that, in the United States, the census begins only with 1790, the achievement of the primitive St. Lawrence colony in instituting what is to-day one of the principal instruments of government throughout the civilized world, may call for more than passing appreciation.

The Census of 1666 (the results occupy 154 pages in manuscript, and are still to be seen in the Archives of Paris, or in a transcript at Ottawa) showed some 3,215 souls. It was repeated at intervals more or less regularly for a hundred years. By 1685 the total had risen to 12,515, including 1,538 Indians settled in villages and living a civilized life under the supervision of the missionaries. By the end of the century it had passed 15,000, and this was doubled in the next twenty-five years. Not to present too much detail, some of which is in the Chronology on pp. 25-36, it may be said that at the time of the cession (1763) the population of New France was nearly 70,000 (69,810 in 1765), while another 10,000 French (thinned to these proportions by the expulsion of the Acadians) were scattered through what are now Nova Scotia, New Brunswick, and Prince Edward Island. The British population of Nova Scotia was 8,104 in 1762, thirteen years after the foundation of Halifax in 1749.

The chief sources of statistics for half a century and more after the cession are the reports—more or less sporadic—of colonial governors, though censuses of the different sections under British rule were taken at irregular intervals. British settlement on a substantial scale in the Gulf provinces and in Ontario dates only from the Loyalist movement that followed the American Revolution, at the end of which, i.e., about the year of the Constitutional Act (1791), the population of Lower Canada was approximately 163,000, while the newly constituted Province of Upper Canada, under Lieutenant-Governor Simcoe, numbered perhaps 15,000, and the addition of the maritime colonies brought the total to well over 200,000. A decade later Canada began the nineteenth century with a population of probably not less than 250,000 or 260,000. Subsequent censuses gave the populations of the different colonies as follows: Upper Canada (1824) 150,066, (1840) 432,159; Lower Canada (1822) 427,465, (1844) 697,084; New Brunswick (1824) 74,176, (1840) 156,162; Nova Scotia (1817) 81,351, (1838) 202,575; Prince Edward Island (1822) 22,600, (1841) 47,042.\*

The policy of irregular census-taking was supposed to have been ended after the union of Upper and Lower Canada by an Act, passed on Sept. 18, 1841, which provided for a census in the year 1842 and every fifth year thereafter, but under this Act only the census of Upper Canada was taken and the following year, on Dec. 9, the Act was amended, the reason being stated as follows: "Whereas the Census of the inhabitants of Lower Canada, for the year one thousand eight hundred and forty-two as required by an Act of this Legislature, . . . hath not been duly taken . . .

\* A résumé of the results of all the censuses taken in Canada between 1666 and 1931 has been published in bulletin form and is included in Vol. I, Census of 1931.

and whereas it is of the greatest importance that such Census should be taken. . . . Be it therefore enacted . . .". The Census of 1844 of Lower Canada was taken under this Act.

Another Act was passed and given Royal Assent on July 28, 1847, creating a "Board of Registration and Statistics" with instructions "to collect statistics and adopt measures for disseminating or publishing the same" and providing for a census to be taken in the year 1848, to be repeated in 1850 and every fifth year thereafter. Under this Act a census of Upper Canada was taken in 1848.

Finally an Act was passed on Aug. 30, 1851, providing for a census to be taken in January, 1852, then in the year 1861 and thereafter every tenth year, and that better provision should be made for taking the census. The first census thereunder was taken in January, 1852, and, as similar censuses were taken by New Brunswick and Nova Scotia, there is a regular measure of population growth in Canada over the past 80 years. The 'fifties saw a very rapid development, especially in Ontario, and the 'sixties showed only less substantial gains. In the years following Confederation there was a spurt, the increase between 1871 and 1881 (which included several lean years towards the end) being 635,553, or 17·23 p.c. In neither of the last two decades of the nineteenth century, however, was this record equalled either absolutely or relatively, the gains in each being under 550,000, or 12 p.c. By the end of the century the population of Canada had reached approximately five and a third millions, or twenty times that of 1800. It has increased by five millions in the past thirty years.

**Expansion in the Twentieth Century.**—It is within the present century that the most spectacular expansion of the population of Canada has taken place. The outstanding feature was, of course, the opening to settlement of the West. The unorganized territories of British North America had been ceded to the Dominion soon after Confederation, and the West had been tapped and traversed by the Canadian Pacific Railway in the 'eighties and 'nineties. But, though western population was doubled in each of these decades, it was only with the launching of a large-scale immigration movement after 1900 that western settlement and production became a first-rate economic factor. Simultaneously an almost equally striking development occurred in the industrial centres of Eastern Canada, forming the immediate basis for the move upon the West. At the back, of course, was the heavy inflow of British and other capital—a total of \$1,500,000,000 between 1900 and 1912—to finance large constructive undertakings (chiefly railway, municipal, and industrial) which characterized the movement. The years 1901 to 1911, in brief, form the *decas mirabilis* of Canadian expansion. The immigration movement just mentioned, which had previously run well under 50,000 per annum, rose rapidly to over five times that volume, eventually passing 400,000 in a single year. In the ten years between 1901 and 1911 it exceeded 1,800,000 and, though at least a third of these were lost (partly in the return to Europe of labour temporarily attracted by the railway and other developments in progress, and partly in the never-ceasing and natural 'drag' of the United States upon a virile and less wealthy people), it formed the chief factor in the gain of 34 p.c. which the total population of Canada registered in that decade, and which was larger than the relative growth of any other country during the same period. The movement was continued and even intensified in the first three years of the second decade of the century, after which a recession set in, to which the outbreak of war gave a new and wholly unexpected turn. Nevertheless, the decade that closed with the Census of 1921

showed over 1,700,000 immigrant arrivals in Canada, and, though the proportionate loss of these was very heavy (probably as much as two-thirds), Canada's relative gain for the decade was again among the largest in the world.

**Results of the Census of 1931.**—The total population of the Dominion on June 1, 1931, was 10,376,786, as compared with 8,787,949 on June 1, 1921, an increase of 1,588,837 or 18·08 p.c. in the decade, as compared with 21·94 p.c. and 34·17 p.c. during the decades 1911 to 1921 and 1901 to 1911, respectively.

During the decade 1911-21 the countries that comprise the British Empire, and more especially the United States (which was in the Great War for only nineteen months as against Canada's fifty-two,) had suffered less in actual loss of life from the War and its consequences than the continental countries of Europe. None of them declined in population during the period, as many continental European countries did. Their percentage increases, however, were in almost all cases lower than in the previous decade. Thus the population of England and Wales increased between 1911 and 1921 only from 36,070,492 to 37,886,699, or 5·0 p.c., as compared with an increase of 10·9 p.c. in the previous decade; Scotland, again, increased only from 4,760,904 to 4,882,497, or 2·6 p.c., as compared with 6·5 p.c. between 1901 and 1911. Nor has this situation been much improved in the post-war decade 1921-31, for the increase in England and Wales during these years was but 5·4 p.c. and Scotland actually showed a decrease of 0·8 p.c. Of the overseas Dominions, New Zealand, according to the official estimate\* increased her population from 1,218,913 to 1,452,747, or by about 19 p.c. for the decade ended 1931, as compared with 20·9 p.c. and 30·5 p.c., respectively, for the decades ended 1921 and 1911. In the case of the white population of South Africa, much the same condition obtained. The Commonwealth of Australia, the only Dominion to grow more rapidly in the second decade of the twentieth century than in the first, increased from 4,455,005 in 1911 to 5,435,734 in 1921, or by 22·01 p.c., as compared with 18·05 p.c. for 1901-11, and to 6,552,606 in 1931 according to the official estimate,\* or by 20·5 p.c. in the decade 1921-31. The population of the continental United States increased between 1920 and 1930 from 105,710,620 to 122,775,046, an increase of 16·1 p.c. as compared with 14·9 p.c. in the decade 1910-20 and 21 p.c. in the decade 1900-10.

Considering now the movement of population within the Dominion of Canada itself, it is evident from Table 1 that in this country, as formerly in the United States, there has been a distinct movement of population from east to west. In the decade from 1911 to 1921 this was clearly apparent, for the four western provinces then increased their population by no less than 44 p.c. This growth occurred chiefly in the three Prairie Provinces for their combined population increased in the decade by 47·3 p.c., while that of British Columbia increased by 33·6 p.c. In the first two decades of the century the economic factor that had the greatest influence on population growth and movement in Canada was undoubtedly the agricultural settlement of the Prairie Provinces. The growth of population in these provinces was assisted both by immigration into Canada and by movement of domestic population from east to west.

While the agricultural industry of the Prairie Provinces has encountered periods of serious difficulty since the War of 1914-18, major economic developments have

\* In both New Zealand and Australia the 1931 censuses were postponed and were taken in March, 1936, and June, 1933, respectively

been in progress in the mining, forest products, and hydro-electric power industries of Quebec, Ontario, and British Columbia. Furthermore, in this period immigration has been less important as a factor in population growth (see Table 1, p. 70) than in pre-war years, and thus the high rate of natural increase in Quebec (see Table 32, p. 141) has become a relatively greater factor. The Census of 1931 revealed the changing trends resulting from these influences, for in this latest decade the population of British Columbia increased 32.3 p.c. and of Quebec 21.7 p.c. compared with 20.3 p.c. for the Prairie Provinces. This change is also indicated by the percentage figures of Table 2, p. 71. The 1936 Quinquennial Census of the Prairie Provinces showed very little growth of population in those provinces in the five-year period after 1931.

**Microphotography as Applied to Canadian Census Records.**—This method of preserving records in condensed form was introduced in the Dominion Bureau of Statistics in June, 1939. The principle of the method is that each page of record is photographed in very reduced size on a roll of film. The completed film is indexed and stored in specially-constructed steel cabinets fitted with apparatus to regulate the moisture content of the air, since this factor has a pronounced effect on the preservation of the film. When it becomes necessary to consult the records, the film is placed in a projector which magnifies the photographed records so that they can be read easily.

Up to the present time, the Census Branch alone is making use of microphotography, although its value for library records is also under consideration. The space required to house the census records is very great as all primary records from 1871 to the present time must be kept in readily available form. Census records provide basic data for many purposes; among other things they are used to verify applications for old-age pensions, the number of which has increased rapidly since all the provinces have come under the Act, and are fundamental to many other administrative departments of government. The micro-film, which becomes the record to which ready access is made, can be stored in less than 1 p.c. of the space required for the original records; the latter can then be stored away permanently in less valuable space.

Another advantage of the system is that constant handling of original schedules, which results in their rapid deterioration, is eliminated. The microphotographic method permits the original records to be maintained in good condition indefinitely. Again, the weight of the micro-film is infinitesimal as compared to the weight of the folders containing the original schedules, and, as many trips to the record stacks are required each day, considerable effort has been involved in the task of lifting and carrying the heavy schedules. The cabinets containing the films can be conveniently brought to the point where the clerks are working.

**Centres of Population.\***—The centre of population for the Dominion of Canada was carefully worked out for each census from 1851 to 1931, inclusive, and

\* The centres of population are the centres of gravity (not the intersections of median lines). The units of area in which the moments (i.e., population multiplied by distance from a fixed point) were calculated, were the permanent counties or census divisions, of which there are about 220, the same units being used so far as possible for all censuses from 1851 to 1931. The geographical centre of the unit area was assumed to be the centre of population of that unit except in the cases of the thinly settled northern areas and of counties with very large cities, where special adjustments were made.

showed a definite north-westward movement up to 1911, westward for the next decade, and northward for 1931. For the censuses of 1851 to 1881 the location was near Valleyfield, Que.; in 1891, it was 25 miles west of Ottawa; in 1901, near Pembroke; in 1911, 45 miles west of Sudbury; in 1921, 50 miles northeast of Sault Ste. Marie; and in 1931, 35 miles north of Sault Ste. Marie.

**Density of Population.**—The density of population in 1931 (i.e., the number of persons per square mile of the land area as in that year), as compared with 1921, 1911, and 1901, is shown by provinces and for the country as a whole in Table 5.

#### 5.—Area and Density of Population of Canada, by Provinces, 1901-31.

<b>Canada.....</b>	<b>3,466,556</b>	<b>5,371,315</b>	<b>1.55</b>	<b>7,206,643</b>	<b>2.08</b>	<b>8,787,949<sup>2</sup></b>	<b>2.53</b>	<b>10,376,786</b>	<b>2.99</b>

<sup>1</sup> The populations of Ontario, Quebec, Manitoba, and Northwest Territories were adjusted for 1911 according to the provisions of the Boundary Extensions Acts, 1912, but such adjustment was not carried back to 1901 and this accounts for the apparent decrease of population of the Northwest Territories from 1901 to 1911.

<sup>2</sup> Populations of Northwest River Arm and Rigolet, on Hamilton Inlet have been deducted from Quebec, as these parts were awarded to Newfoundland by decision of the Judicial Committee of the Privy Council, Mar. 1, 1927. The grand total for Canada also contains 435 members of the Royal Canadian Navy who were recorded separately in 1921.

<sup>3</sup> Revised since the publication of the 1939 Year Book.

Figures showing the density of population in 1931, by counties and census divisions, are given in Table 6. Generally speaking, the density of population decreases as one travels westward, but the enormous area of the Province of Quebec unduly reduces the density of its population, which was 5.49 in 1931. As among the nine provinces, the density of population is greatest in Prince Edward Island and least in British Columbia.

# Census Divisions of Western Canada 1931

The densities of population in various countries in recent years are given in Table 7. It should not be assumed, however, that a low density is necessarily evidence of under-population. If density could be expressed in terms of estimated habitable area, the figures would be more comparable, but even then natural physical factors, such as climate, topography, physical condition of the soil, mineral wealth, etc., would not be adequately weighted. These considerations should be borne in mind when comparing the figures of this table.

### 7.—Densities of Population in Various Countries in Recent Years.

NOTE.—The following figures, for countries other than Canada and China, are based on data taken from the Statistical Year Book of the League of Nations, 1938-39. The population figures of the latest census are used and total population is taken except where indicated otherwise by footnotes.

Country.	Year.	Persons per Sq. Mile.	Country.	Year.	Persons per Sq. Mile.

<sup>1</sup> Estimate as of Dec. 31, 1931, taken from Canada Year Book, 1934-35, p. 168.  
Dec. 31, 1936, as the census figures for Russia in Europe are not available.

<sup>2</sup> Estimate as at  
<sup>3</sup> Estimate as at Dec.  
31, 1937.

**Elements of Growth.**—The factors involved in estimating population movement and growth are: natural increase, which is a resultant of births and deaths; immigration; and emigration. As explained on p. 105, co-operation in the collection of vital statistics (births, marriages, and deaths) in Canada was a consequence of the establishment of the Dominion Bureau of Statistics in 1918, and vital statistics for all provinces except Quebec were made available on a uniform basis for the first time for the years 1921 to 1925. Quebec has been included in the registration area from Jan. 1, 1926, and, since that time, figures for all provinces have been comparable.

Immigration figures are available from the old records of the Department of Immigration or, since 1936, from the Immigration and Colonization Branch of the Department of Mines and Resources, for a period antedating Confederation by fifteen years (see p. 147). It is very difficult, however, to obtain correct figures for emigration; no record of this movement is kept by the Canadian Government, although its magnitude is indicated by United States, United Kingdom, and other British returns of Canadian immigrants to those countries. Even these figures cannot, however, be taken at their face value since no allowance is made for Canadians returning to Canada after a more or less extended period of residence in the United States or British countries outside Canada. Since 1924, however, the Canadian

Government immigration officers have been instructed to take note of such Canadians returning from the United States. This group, of course, covers the greater part of "returning Canadians".

Estimates of Canadian emigration based on United States and British returns, supplemented by the known figures for "returning Canadians" are made by the Social Analysis Branch of the Dominion Bureau of Statistics in the process of working out the annual estimates of population. These estimates are the closest available but are naturally subject to a margin of error because of the incomplete data upon which they are based and the fact that they are calculated for a period of time ahead of actual experience. Moreover, the annual estimates of population are not calendar year statistics but are from June 30 to July 1, respectively, and naturally such emigration estimates as are made are on the same basis.

It will be clear, therefore, that, while the *trend* of emigration can be obtained by the interested reader from the statistics given in Table 8, he would not be justified in adding together natural increase and immigration for any year and expecting the total, when subtracted from the estimated increase in population, to represent the emigration for that year.

**8.—Summary of Births, Deaths, Natural Increase, and Immigration, Calendar Years, with Estimated Population as at June 1, 1921-39.**

Year.	Calendar Year Data.				Data for Year Ended June 1.

<sup>1</sup> Revised since the publication of the 1939 Year Book.

## Section 2.—Sex Distribution.

Throughout the older countries of the world there is usually found an excess of female over male population, more especially as in most of these countries the census is taken on a *de facto* instead of, as in Canada, on a *de jure* basis. The causes of this excess of female population are: (1) the normally higher rate of mortality among males; (2) the greater number of males who travel; (3) the effects of war; (4) the employment of males in the army, navy, and merchant marine; and (5) the preponderance of males among emigrants. In the newer countries of the world, however, the preponderance of males among immigrants results in a general excess of male over female population. These phenomena are exemplified for both the older and the newer countries in Table 9.

### 9.—Masculinity of the Populations of Various Countries in Recent Years.

NOTE.—A minus sign denotes a deficiency of males. The figures are calculated from population figures of the latest census in each case, as given by the League of Nations Year Book, 1938-39.

<sup>1</sup> Estimate.

<sup>2</sup> Revised since the publication of the 1939 Year Book.

In Canada there has been an excess of male population from the commencement of its history, the first census (1666) showing 2,034 males to only 1,181 females. As the colony increased in numbers, the disproportion between the sexes became smaller, more especially since the French-Canadian population, after about 1680, was not reinforced by immigration from the Old World. In 1784, when the English-speaking immigration to Canada for purposes of settlement was commencing, there were 54,064 males and 50,759 females in the colony. At the middle of the nineteenth century, there were 449,967 males to 440,294 females in Lower Canada, and 499,067 males to 452,937 females in the more newly-settled Upper Canada, and since Confederation the same phenomenon of considerable excess of males has occurred throughout the growing northwest. The great immigration of the first decade of the present century resulted in raising what is called the 'masculinity' of the Canadian population (i.e., the excess of males over females per 100 of population) to the highest point in recent history, viz., 6.07 p.c. in 1911. The War of 1914-18, however, both checked immigration and took about 60,000 young Canadian male lives as its toll, with the result that at the Census of 1921 the masculinity of the population was only 3 p.c.—515 males to 485 females per 1,000 of population.

In 1931 there were 518 males to 482 females for Canada as a whole. It is interesting to note that the masculinity of the population has increased in the eastern provinces and decreased in the western ones, where it was formerly greatest. In Table 10 statistics are presented showing the number of males and females in each of the provinces and territories at each census since 1871. A table showing the proportions of the sexes and excess of males per 1,000 of population, 1871-1931, appears at p. 113 of the 1934-35 Year Book.

<sup>1</sup> Includes 485 members of the Royal Canadian Navy.

**Section 3.—Conjugal Condition.**

In Table 11 are given, in summary form, the statistics of the conjugal condition of the population, as single, married, widowed, divorced, and legally separated, for 1871 and subsequent censuses. Especially notable is the larger proportion of married in the more recent years. This is mainly attributable to the larger proportion of adults to total population at the present time. Noteworthy also is the larger proportion of divorced and legally separated in later years. A table showing the conjugal condition of the people, as percentages of the total population, is given at p. 110 of the 1936 Year Book. Another table, showing conjugal condition by sex and provinces, will be found at the same place. At pp. 115-116 of the 1934-35 Year Book a table appears showing the conjugal condition of the 1931 population, 15 years of age or over by age groups. The reader is referred to pp. 117-120 of this volume for further information concerning marriages and to pp. 120-121 for details of divorces granted in the years 1918-39.

# 11.—Conjugal Condition of the Population, as Shown by the Censuses of 1871-1931.

NOTE.—Dashes in this table indicate that no data were reported under the respective headings.

Census Year and Sex.	Single.	Married.	Widowed.	Divorced.	Legally Separated.	Not Given.	Total.
1871—Male.....	1,183,787	543,037	37,487	—	—	—	1,764,311

<sup>1</sup> The figures for 1871 cover the four original provinces of Canada only.  
included with divorced.

<sup>2</sup> Legally separated

<sup>3</sup> Legally separated included with married.

## Section 4.—Age Distribution.

The same causes that have, in the past, rendered the sex distribution of population in Canada somewhat unusual have also affected its age distribution. In the first stages of the settlement of a new colony, men in the prime of life constitute the bulk of the population, and women and children are conspicuous by their absence, so that there will be a disproportionately large male population between the ages of 20 and 50, together with a low birth rate. Later on in the settlement of a new country, where there is land and food for all and where the early disproportion of the sexes has been overcome, there is a very high rate of natural increase, and an extraordinarily large proportion of children among the population. Thus in 1871 (see Table 12), 286·91 out of every 1,000 of the population of Canada were children under 10 years of age, and over half the total population (526·76 out of every 1,000) were under 20 years of age. But, with the growing urbanization of population, the average age at marriage increased and children came to be regarded as a liability rather than an asset. Thus in 1911, out of every 1,000 of the population, only 231·83 were under 10 years of age and 423·42 under 20 years of age. In 1921, however, 239·67 per 1,000 of the population were under 10 years of age and 434·81 per 1,000 under 20 years. In 1931, the number of children under 10 years of age had dropped to 212·70 per 1,000 of the population, and of persons under 20 to 416·39 per 1,000.

**Age Distribution by Sex.**—An interesting table of quartile and decile age distribution, by sex, with textual interpretation, is given at pp. 119-120 of the 1934-35 Year Book.

## Section 5.—Racial Origins.

In six out of seven censuses of Canada since Confederation the racial origin of each person has been secured, the exception being 1891. The object of this information is to ascertain from what basic ethnic stocks the Canadian population, more particularly the recently immigrated population, is derived. The answer "Canadian" is not accepted under this heading, as the purpose of the question is to obtain, in so far as possible, a definition of "Canadian" in terms of racial derivation. Of this procedure of the census, criticism has been received on two main grounds: (a) There are Canadians whose families have resided in the country for several generations who may not know their ultimate racial origin, or who may be of very mixed origin. (b) The practice tends to perpetuate racial distinctions which it is desirable to obliterate. As against these criticisms the following three points must be considered: (a) The Canadian whose family is of three or more generations residence is enumerated and differentiated through the census question on the birthplace of parents for which statistics from the 1931 Census appear at pp. 134-139 of the 1934-35 Year Book. (b) Notwithstanding the desirability of racial assimilation, there are special features in connection with the process that require appraisalment and study—for example, 271 children of Chinese fathers and 842 of Japanese fathers were born in Canada in 1931. Again, the fact that the constitution of Canada is based on the presence of two dominant races points to the desirability of a measurement of these factors: only recently it has been widely pointed out that the original French colony, numbering 70,000 at the

date of the Conquest, has expanded to over three millions to-day. Measurements of this kind would be impossible if the answer "Canadian" instead of "French" were accepted under the heading of racial origin, yet undoubtedly if the descendants of the original French colonists are not "Canadians", no one is. (c) Finally, racial origin is an important subject for study in a new country like Canada from a scientific standpoint, i.e., from the standpoint of the student of ethnology, criminology, and the social and "biometric" sciences in general.

To accept the answer "Canadian" to the question on racial origin would confuse the data and defeat the purpose for which the question is asked.

**Racial Distribution.**—The total increase in population over the decade 1921-31 was 1,588,837. The population of English origin increased by only 196,061 compared with 674,090 in the previous decade; that of Scottish origin by 172,725 compared with 146,610; and that of Irish origin by 123,005 compared with 33,065. The population of British origin, taken together, increased from 4,868,738 to 5,381,071, or by 512,333, between 1921 and 1931. This represented 32 p.c. of the total increase as compared with 55 p.c. of the total increase for the previous decade. On the other hand, the population of French origin increased from 2,452,743 in 1921 to 2,927,990 in 1931, or by 475,247 (slightly under 30 p.c. of the total increase for the decade) and showed the greatest absolute increase for any decade since 1871. Figures for the minor racial groups that help to compose the nation (see Table 14) indicate that the people of Scandinavian, German, and Ukrainian origins increased between 1921 and 1931 by 36 p.c., 61 p.c., and 111 p.c., respectively. Owing to the new national and racial alignments in Central and Southeastern Europe following the War of 1914-18, comparison of the post-war numerical strength of certain ethnic stocks in Canada with pre-war returns cannot be made with any certainty. For example, a number of people reported as of Ukrainian stock in the Seventh Census were described in the Censuses of 1921 and 1911 as Galician, Bukovinian, Ruthenian, or Russian.

Together, the British and French groups constituted, in 1931, 80 p.c. of the total population, compared with 83 p.c. in 1921, 84 p.c. in 1911, 88 p.c. in 1901, 89 p.c. in 1881 and no less than 92 p.c. in 1871. The immigration of continental Europeans to Canada during the past thirty years has, of course, been the cause of this decline.

Table 14 gives the origins of the people of Canada for the Censuses of 1871 to 1931. A perspective of the percentage relationship of the origin groups to the population as a whole is given in tabular form for the same years at p. 123 of the 1934-35 Year Book. The percentage figures for 1911 should, however, be changed in accordance with the revised figures for that year as given in Table 14.

## 14.—Origins of the People of Canada, Census Years, 1871-1931.

NOTE.—Origins were not taken in the Census of 1891. Dashes in this table indicate that no data were reported under the respective headings.

<sup>1</sup> The figures for 1871 cover the four original provinces of Canada only.

<sup>2</sup> Figures for individual

origins revised by the redistribution of 130,413 "Unspecified" since the publication of the 1938 Year Book.

<sup>3</sup> Incomplete in 1871; includes "half-breeds" in 1901.

<sup>4</sup> Includes Danish, Icelandic, Norwegian, and Swedish; in 1921 they numbered, respectively, 21,124, 15,876, 68,856, and 61,503; in 1931, 34,118, 19,382, 93,243, and 81,306.

## Section 6.—Religions.

At each of the censuses from 1871 to 1931 every inhabitant of Canada has been asked to state the religious body of which he is a member or an adherent. During the sixty-year period there have been various fluctuations in the proportions of the population belonging to the leading religious bodies, and these fluctuations are, in a new country like this, largely occasioned by the religious affiliations of immigrants.

Throughout the sixty-year period something like two-fifths of the population of Canada has been of the Roman Catholic faith, the 1931 percentage, inclusive of Greek Catholics, being 41·30. Methodists were 16·27 p.c. of the population in 1871 but fell to 13·19 p.c. in 1921, while Presbyterians increased from 15·63 p.c. in 1871 to 16·04 p.c. in 1921, being reinforced by a considerable immigration from Scotland after the beginning of the century. The fusion of the Methodists and Congregationalists in 1925 with a large section of the Presbyterians, as the United Church of Canada, made that body the second largest religious body in the Dominion in 1931 with 19·44 p.c. of the population. The Presbyterians who did not adhere to the United Church of Canada amounted to 8·39 p.c. of the population in 1931. The proportion of Anglicans in the population of Canada fell from 14·17

p.c. in 1871 to 12.69 p.c. in 1901 but thereafter the large immigration from the British Isles raised it to 16.02 p.c. in 1921, followed by a slight falling-off to 15.76 p.c. in 1931. The Baptists have shown a fairly steady decline from 6.87 p.c. in 1871 to 4.27 p.c. in 1931.

The immigration from non-English-speaking countries during the first three decades of the twentieth century led to a great growth of the religious bodies that have as their home the Continent of Europe. Thus the Lutherans, who were only 1.09 p.c. of the population in 1871 and 1.72 p.c. in 1901, rose to 3.80 p.c. in 1931. The Jews, again, who were only 0.03 p.c. in 1871 and 0.31 p.c. in 1901, were 1.50 p.c. in 1931. The adherents of the Greek Orthodox Church, who in earlier years were not distinguished from Greek Catholics (the two together being only 0.29 p.c. in 1901) were 0.99 p.c. in 1931.

Of the total population in 1931 (10,376,786), 16,042 or 0.15 p.c. did not state their religion while 54,164 persons, or 0.52 p.c., belonging to small sects, were classed as "various" and 21,071 or 0.20 p.c. as of "no religion". Of the non-Christian sects, 155,614 or 1.50 p.c. were Jews, 24,087 or 0.23 p.c. were Confucians, 15,784 or 0.15 p.c. were Buddhists, and 5,008 or 0.05 p.c. were pagans. In Table 15 the totals for each religion are brought together for all censuses since Confederation. Further analyses showing the percentages of specified religions at each census, 1871-1931, and the numbers accredited to each specified religion, by provinces, are given at pp. 127-129 of the 1934-35 Year Book. In 1931, for the first time in the history of the Dominion Census, the religions of the people were cross-classified according to racial origin. The results, for Canada as a whole, are shown at pp. 116-117 of the 1936 Year Book.

### 15.—Religions of the People of Canada, Census Years, 1871-1931.

NOTE.—Dashes in this table indicate that no data were reported under the respective headings.

<b>Totals.....</b>	<b>3,485,761</b>	<b>4,324,810</b>	<b>4,833,239</b>	<b>5,371,315</b>	<b>7,206,643</b>	<b>8,787,949</b>	<b>10,376,786</b>

<sup>1</sup> The figures for 1871 cover the four original provinces of Canada only. <sup>2</sup> Including Tunkers.  
<sup>3</sup> Mennonites were included with Baptists prior to 1901. <sup>4</sup> Practically all Methodists and Congregationalists and a large number of Presbyterians united to form the United Church of Canada in 1925, although a relatively small number reported themselves as "United Church" in 1921, chiefly in Western Canada where the movement towards union began. <sup>5</sup> In earlier censuses only small numbers were involved, and Greek Catholics and Greek Orthodox were included under the general term "Greek Church".  
 A rapid increase of both Greek Catholics and Greek Orthodox has been shown for recent censuses and, since the former owe obedience to the Pope in matters of faith, they have been included with the Roman Catholics for 1931. <sup>6</sup> Included with "All other" religions for 1891. <sup>7</sup> Including 186,654 Greek Catholics (see footnote 5).

## Section 7.—Birthplaces.

The birthplaces of the population of Canada, as at each of the seven censuses, are shown by "Canadian Born", "Born Elsewhere", and "Foreign Born" ("United States Born" and "Other Foreign Born"), in Table 16. The table shows that, in 1871, 97.28 p.c. of the population was born under the British flag, while sixty years later the percentage had declined to 89.18. The proportion of Canadian born increased steadily until the opening of the century, but has declined as a result of the increase of immigration after 1900. The Census of 1931 showed declines in the proportions of other British born and United States born as compared with 1921 but an increase in the percentage of other foreign born; the proportion of Canadian born has remained practically unchanged.

Worthy of note is the fairly steady increase of population born in the United States from 1.85 p.c. in 1871 to 4.25 p.c. in 1921, and the subsequent decline to 3.32 p.c. in 1931. Other foreign born increased from 0.87 p.c. in 1871 to 6.23 p.c. in 1911, declined to 5.87 p.c. of the total population by 1921 but, as already noted, increased substantially to 7.50 p.c. by 1931.

## 16.—Birthplaces of the Population of Canada, by Numbers and Percentages, Census Years, 1871-1931.

Year.	Canadian Born.	Other British Born. <sup>1</sup>	Foreign Born.		Total Popula- tion.	Percentages of Total Population.			
			Born in United States.	Born Else- where.		Canadian Born.	Other British Born.	Foreign Born.	
								Born in United States.	Born Else- where.
	No.	No.	No.	No.	No.	p.c.	p.c.	p.c.	p.c.
1871....	2,894,591	496,502	64,447	30,221	3,485,761	83.04	14.24	1.85	0.87
1881....	3,721,826	478,615	77,753	46,616	4,324,810	86.06	11.07	1.80	1.08
1891....	4,189,368	490,573	80,915	72,383	4,833,239	86.68	10.15	1.67	1.50
1901....	4,671,815	421,051	127,899	150,550	5,371,315	86.98	7.84	2.38	2.80
1911....	5,619,682	834,229	303,680	449,052	7,206,643	77.98	11.58	4.21	6.23
1921....	6,832,224	1,065,448	374,022	516,255	8,787,949	77.75	12.13	4.25	5.87
1931....	8,069,261	1,184,830	344,574	778,121	10,376,786	77.76	11.42	3.32	7.50

<sup>1</sup> Includes some hundreds of persons born at sea.

The birthplaces of the 1931 population are tabulated for the various provinces and territories, by sex, at p. 118 of the 1936 Year Book. In the Maritime Provinces, the population is shown by the Census of 1931 to be about 93 p.c. native born,

and in Quebec about 91 p.c. In Ontario, however, the proportion sinks to about 77 p.c., in Manitoba to about 66 p.c., in Saskatchewan to about 65 p.c., in Alberta to about 58 p.c., and in British Columbia to about 54 p.c.

At pp. 133-140, inclusive, of the 1934-35 Year Book, a very complete analysis is given of the birthplaces of the Canadian people. Tables there published show: population classified by province of residence and province of birth; population, for each province, classified by nativity of parents; Canadian born classified according to nativity of parents, by racial origin; and rural and urban population, other than Canadian born, classified according to year of arrival in Canada.

### Section 8.—Citizenship and Naturalization.

At the latest four decennial censuses, those of 1901, 1911, 1921, and 1931, inquiry has been made into the citizenship of the foreign-born population. The relevant instructions given to enumerators at the Census of 1931 are published at p. 141 of the 1934-35 Year Book.

Table 17 deals with the citizenship of the Canadian born, the British born, and the foreign born of the population residing in Canada at the date of the Census of 1931. As regards the total (8,069,261) native-born population, 8,052,459 were "Canadian Nationals" and were made up of 8,051,142 persons with uninterrupted citizenship and 1,317 naturalized repatriates. Of the total native born resident in Canada at the date of the census, 16,802 were aliens owing their allegiance to some foreign country—in the case of females usually as a result of marriage. The table on p. 142 of the 1934-35 Year Book shows the country to which allegiance was owed by these 16,802 Canadian-born aliens.

In the case of British born, 11.4 p.c. had not yet acquired Canadian domicile and of the foreign born 45.2 p.c. were still aliens. A more detailed analysis than that given below will be found at p. 143 of the 1934-35 Year Book.

#### 17.—Citizenship of Native-Born, Other British-Born, and Foreign-Born Residents in Canada in 1931, by Sex, According to Allegiance.

Nationality.	Native Born.			Nationality.	Other British Born.

<sup>1</sup> This column includes foreign-born persons born in places other than continental Europe, Asia, or the United States.

<sup>2</sup> The European country of allegiance is given at p. 143 of the 1934-35 Year Book.

**The Progress of Naturalization.**—The foreign-born residents of Canada numbered 1,122,695 in 1931 as compared with 890,277 in 1921, 752,732 in 1911, and 278,449 in 1901; among these the naturalized numbered 614,971 in 1931, 514,179 in 1921, 344,557 in 1911, and 153,908 in 1901, or 54.78 p.c., 57.75 p.c., 45.77 p.c., and 55.27 p.c., respectively. Alien residents in Canada showed an absolute decline between 1911 and 1921 of from 408,175 to 376,098, i.e., from 5.66 p.c. of the population to 4.28 p.c. Between 1921 and 1931, they increased to 507,724, or 4.89 p.c. of the 1931 population. Among the foreign-born residents of Canada, the United States born exceeded those born in any other country, although by continental groups the Europeans were more numerous. Between 1921 and 1931 the U.S. born declined from 374,022 to 344,574, but there was a substantial net increase in the total foreign born due to the large increase of Europeans. On the other hand, the percentage of the U.S. born who were naturalized to total U.S. born increased from 63.63 in 1921 to 72.44 in 1931, whereas the percentage of continental Europeans who were naturalized fell from 57.88 in 1921 to 49.13 in 1931.

## Section 9.—Language Spoken and Mother Tongue.

**Official Languages.**—In the Census of 1931, 1,322,370 persons were reported as speaking both the official languages of Canada, 6,999,913 speaking English, 1,779,338 speaking French and 275,165 as unable to speak either English or French. In a table on p. 121 of the 1936 Year Book the population is classified by racial origins and ability to speak one, both, or neither of the official languages.

**Rural and Urban Distribution.**—One interesting sidelight that analysis of the data from the 1931 Census has shown is the respective capacities of rural and urban people to speak the official languages; it is especially interesting to compare the proportions of them that are able to speak both languages and also the proportions unable to speak either. About twice as many speak both French and English in urban localities as in rural localities, and about three times as many of the latter as the former speak neither of these languages. There is, of course, greater opportunity for intermingling in urban residence than rural, and probably also greater necessity for acquiring the official languages in urban occupations. The obvious conclusion or expectation would be that larger proportions among the urban populations than among the rural have *acquired* both official languages. But other

factors enter into the question, since the acquisition of both official languages is as much a matter of capacity to acquire them as of opportunity, intermarriage, necessity, and so on.

Table 18 compares the percentages of the rural and urban population of Canada speaking both official languages and speaking neither of them, classified by sex and age in 1931.

**18.—Percentages of the Rural and Urban Populations of Canada Speaking Both or Neither Official Languages, by Quinquennial Age Groups and Sex, 1931.**

Age Group.	Percentage Speaking Both French and English.				Percentage Speaking Neither Language.			
	Males.		Females.		Males.		Females.	
	Rural.	Urban.	Rural.	Urban.	Rural.	Urban.	Rural.	Urban.

**Mother Tongue.**—At p. 122 of the 1936 Year Book will be found a table showing the mother tongues of the population, by provinces and for the Dominion.

### Section 10.—Rural and Urban Population.

For the purposes of the census the population residing in cities, towns, and incorporated villages has been defined as urban, and that outside of such localities as rural. Thus the distinction here made between 'rural' and 'urban' population is a distinction of provincial legal status rather than of size of aggregations of population within limited areas. Since the laws of the various provinces differ in regard to the population necessary before a municipality may be incorporated as urban (the laws of Saskatchewan, for example, making provision that 50 people actually resident on an area not greater than 640 acres may claim incorporation as a village, while the Ontario law now requires that villages asking for incorporation shall have a population of 750 on an area not exceeding 500 acres), the line of demarcation between rural and urban population is not at all uniformly drawn throughout the Dominion, as far as comparable aggregations of population are concerned.

A table published at p. 147 of the 1934-35 Year Book gives the rural and urban populations, by provinces and sex, and divides the incorporated urban centres into two groups, viz., under one thousand, and one thousand or over, thereby allowing a closer comparison than is possible from Table 19. The population in urban places having less than one thousand is shown to have decreased for the whole of Canada but increased in Prince Edward Island, Nova Scotia, and British Columbia. In Table 19 are given statistics showing the growth of rural and urban

population, respectively, by provinces, since 1891. To a limited extent Table 20 will permit the student of population statistics to make, at least for Canada as a whole, his own line of demarcation between rural and urban populations.\*

While a summary comparison between urbanization in Canada in 1931 and in the United States in 1930 would lead us to the conclusion that Canada, though far less densely peopled than the United States, had an almost equally large percentage of its population in urban communities, viz., 53·70 p.c. in Canada as compared with 56·2 p.c. in the United States.\* A fairer basis of comparison is secured if the same population limits are taken for both countries, as may be done by using Table 20. Thus, at the Census of 1930, the United States had 29·5 p.c. of its population resident in cities of 100,000 or over, while Canada in 1931 had only 22·44 p.c. of its population in such places. The United States had an additional 18 p.c. of its population residing in cities of between 10,000 and 100,000 population, and 4·8 p.c. in cities and towns of 5,000 to 10,000, while Canada had in cities of these categories only 14·87 p.c. and 4·42 p.c., respectively, of its population. Thus, taking all places of 5,000 or over—the lowest population for which comparative figures are readily available—52·3 p.c. of the population of the United States resided in such places as compared with 41·73 p.c. of the population of Canada, showing the much higher degree of urbanization that has been reached in the United States—a natural thing in an older settled and more densely peopled country.

On the basis of the census classification, it is apparent from Table 19 that in the decade 1921-31, as in the previous one, urban communities absorbed nearly 77 p.c. of the total increase in population, with the result that the urban population of Canada in 1931 exceeded the rural by 767,330. Out of every 1,000 persons in the country, 463 were resident, on June 1, 1931, in rural and 537 in urban communities, as compared with 505 in rural and 495 in urban communities on June 1, 1921; 546 in rural and 454 in urban communities in 1911; 625 in rural and 375 in urban communities in 1901; and 682 in rural and 318 in urban communities in 1891.

From Table 20, showing the distribution of urban population in Canada by size of cities and towns, it is seen that Canada possessed, in 1931, two cities of more than half a million population. These are Montreal and Toronto, with 818,577 and 631,207 inhabitants, respectively. Two other cities, Vancouver and Winnipeg, have attained the 200,000 mark and Hamilton, Quebec, and Ottawa each have populations of over 100,000. The two western cities of Calgary and Edmonton are now in the 75,000 to 100,000 class. In this respect London, which excelled Edmonton in 1921, now takes the next lower place with a population of 71,148. Details of the population of these and other smaller cities and towns of 5,000 or over, are given by censuses from 1871 to 1931 in Table 21, while the populations of urban communities having, in 1931, a population of from 1,000 to 5,000 each, are given for 1901, 1911, 1921, and 1931 in Table 22.

All the larger cities have in their neighbourhoods growing 'satellite' towns or other densely settled areas in close economic relationship with the central municipality. This phenomenon is to-day of increasing importance largely as a result of the greater ease and speed of transportation by motor vehicle. It has, therefore, been considered advisable to calculate the total populations resident in what the United

\* In the United States, urban population, prior to 1930, was classified by the Census Bureau as that residing in cities and other incorporated places having 2,500 inhabitants or more with certain minor qualifications, but in 1930 the definition was slightly modified to include townships and other political divisions not incorporated as municipalities, having a total population of 10,000 or more each, and a population density of 1,000 or more per square mile. The direct result of this modification has been to increase slightly the proportion of urban population.

States census authorities call the "metropolitan districts". On this basis the total populations of the larger cities at the Census of 1931 were as follows: Greater Montreal, 1,000,159; Greater Toronto, 808,864; Greater Vancouver, 308,340; Greater Winnipeg, 284,295; Greater Ottawa (including Hull), 175,988; Greater Quebec, 166,435; Greater Hamilton, 163,710; Greater Windsor, 110,385; Greater Halifax, 74,161; and Greater Saint John, 55,611.\*

\* See 1931 Census Monograph No. 6, *The Rural and Urban Composition of the Canadian Population*, by S. A. Cudmore and H. G. Caldwell.

<sup>1</sup> Some of the towns of 1891 were included with rural. <sup>2</sup> As corrected in Census Report, Prairie Provinces, 1916. <sup>3</sup> The populations (48,000, 56,446, and 98,967, respectively) in territory now comprised in the Provinces of Alberta and Saskatchewan and in Yukon and the Northwest Territories was classified as rural in the Censuses of 1871, 1881, and 1891. <sup>4</sup> The urban population of 970,791, shown in Vol. I, Census 1911, is reduced to 966,842 by the transfer of the populations of Maniwaki, Martinville, Moisie, St. Bruno, St. Martin, and St-Vincent de Paul from urban to rural; by adjustments in area of the villages of St. Anne and Ste. Geneviève; and Extension of Boundaries Act, 1912. <sup>5</sup> As changed by Extension of Boundaries Act, 1912. <sup>6</sup> Vol. I, Census 1911, places the urban population of Alberta for that year at 141,937. Included in this figure was the population (5,250) of twelve places that, according to the Report of the Municipal Commissioner for Alberta, were not then incorporated. The places so included were Aetna, Banff, Bankhead, Bellevue, Bickerdike, Canmore, Cardiff, Exshaw, Hillcrest, Passburg, Queenston, and Elmpark. The correction resulting from this and from other small adjustments, consequently upon more definite knowledge as to incorporated areas, places the urban population for 1911 at 137,662. Similar corrections have been made in the urban and rural figures for the Census of 1901. <sup>7</sup> This includes South Vancouver and Point Grey, with 1921 populations of 32,267 and 13,736, respectively, which were then classified as 'rural'. <sup>8</sup> Members of the Royal Canadian Navy were counted at their homes in the Census of 1931.

21.—Populations of Cities and Towns having Over 5,000 Inhabitants, Decennial Censuses 1871-1931 and the Quinquennial Census of 1936<sup>1</sup>—continued.

<sup>1</sup> The 1936 figures cover cities and towns of the Prairie Provinces only.

Population is shown in Table 20 to be increasingly attracted to the larger cities. Thus, not only have cities of over 500,000 population (Montreal and Toronto) increased their proportions to the total, but cities of from 100,000 to 500,000 have increased their aggregate population from 5.90 p.c. of the total to 8.46 p.c., and cities of between 5,000 and 100,000 from 17.68 p.c. to 19.29 p.c. in the decade 1921-31. As will be seen, the large absolute increases in the total population of municipalities of less than 1,000 persons for 1921 and 1931 were due almost entirely to the addition of newly incorporated places.\*

\* See also reference in text footnote (\*) at top of p. 94.

## 20.—Urban Populations, Classified by Size of Municipality Groups, 1911, 1921, and 1931.

## 21.—Populations of Cities and Towns having Over 5,000 Inhabitants, Decennial Censuses 1871-1931 and the Quinquennial Census of 1936.<sup>1</sup>

NOTE.—The cities and towns in which a Board of Trade exists are indicated by an asterisk (\*), and those in which there is a Chamber of Commerce by a dagger (†). In all cases the populations for previous censuses have been rearranged as far as possible to cover the same area as in 1931.

<sup>1</sup> The 1936 figures cover towns and villages of the Prairie Provinces only.

<sup>2</sup> Under the Saskatchewan Town Act, Lloydminster, Alberta, is merged with Lloydminster, Saskatchewan, for municipal purposes.

**Rural and Urban Farm Populations.**—At p. 126 of the 1937 Year Book statistics of rural and urban farm population, by provinces, as compiled from the Census of 1931, are given, and at p. 299 of the 1934-35 Year Book details regarding farm workers, those farms employing hired labour, the period of employment, and the cost of labour are shown. The reader is also referred to the item "Wage-earners" (in agriculture) in the Index of the present volume for further information on these topics.

### Section 11.—Literacy.

The subject of literacy is discussed at pp. 131-132 of the 1936 Year Book. At p. 157 of the 1934-35 Year Book will be found a table showing the literacy of the population of 5 years or over from 1901 to 1931, at pp. 158-159 of the same edition the same information as is now summarized in Table 23 is given by sex, while on p. 160 is shown the literacy of the population of cities and towns of 30,000 population or over, as in 1931.

**23.—Literacy of the Population of 10 Years of Age or Over, by Provinces, 1931.**

NOTE.—Corresponding figures for 1921 will be found in the 1924 Year Book, p. 131.

**Section 12.—School Attendance.**

At pp. 132-133 of the 1936 Year Book a treatment of this subject will be found, together with tables showing school attendance: (1) of the population 5-19 years of age, by sex, for the census years 1911, 1921, and 1931, (2) of the total rural and urban populations, by sex, for 1931, and (3) of the population 7-14 years of age, by nativity and sex, for 1931.

**Section 13.—Blind and Deaf-Mutes.**

The 1936 Year Book shows, at pp. 134-135, figures of the number of blind and deaf-mutes by provinces and sex in 1931, together with the number and proportion of such persons as found at the decennial censuses from 1881 to 1931. Summary statistics are repeated at p. 108 of the 1939 Year Book.

**Section 14.—Dwellings and Family Households.**

An extensive treatment of this subject, as it came under observation at the Census of 1931, will be found at pp. 136-139 of the 1936 Year Book.

Two additional tables which supplement that treatment are given at pp. 109-110 of the 1939 Year Book.

## Section 15.—Occupations of the Canadian People.

An article specially prepared for the Year Book, and analysing comprehensively the occupations of the Canadian people as shown by the 1931 Census, appears at pp. 128-146 of the 1937 Year Book.

## Section 16.—Quinquennial Census of the Prairie Provinces.

The latest census of the Prairie Provinces was that taken as of June 1, 1936. The 1937 edition of the Year Book, at pp. 146-152, shows statistics covering the population of each province, by electoral districts, sex, conjugal condition, age distribution, racial origin, birthplace, and by rural or urban habitation. Corrections to these figures with an additional table are given at p. 111 of the 1939 Year Book. The figures are also published in final form in Volumes I and II of the 1936 Census.

## Section 17.—Annual Estimates of Population.

While the populations in different countries are actually counted at decennial or quinquennial censuses, annual estimates of populations are required by modern States for many purposes, such as the calculation of birth, death, and marriage rates, and of per capita figures of production, trade, finance, consumption, etc. In different countries various methods of obtaining annual figures of post-censal populations are adopted. For example, it is possible, with good vital statistics and records of arrivals and departures, to obtain the actual population at any particular date with approximate accuracy by the simple method of adding births and arrivals and subtracting deaths and departures during the period elapsed since the census. This method is impracticable for Canada, with 4,000 miles of common boundary line with the United States, crossed in both directions every day by many thousands of people. In almost all civilized countries, the actual methods of making the estimates vary. Thus, the method of arithmetical progression is widely used in estimating the populations in the older countries of the world; this method involves the annual addition to the population of the country and of particular areas within it of one-fifth or one-tenth of the numerical increase in the last quinquennial or decennial intercensal period. In the case of Canada annual figures of population were purely estimates, made on the basis of past increases, prior to the Census of 1931. They have now been worked out on a basis that takes into consideration collateral data back to 1867, and the resulting figures are believed to state the populations at intercensal periods more accurately than any published prior to 1931.

The new method upon which calculations are based is described at pp. 108-109 of the 1932 Year Book.

---

\* The table of estimates and the description of the method upon which calculations are based are the work of M. C. MacLean, M.A., F.S.S., Chief of Social Analysis, Dominion Bureau of Statistics.

**24.—Estimates of the Population of Canada, by Provinces, Intercensal Years, 1900-39.**

NOTE.—At every census the previous post-censal data are adjusted to the newly recorded population figure. Figures for 1867-99 will be found at p. 141 of the 1936 Year Book.

**Section 18.—Area and Population of the British Empire.**

Statistics of the areas and populations of the territories included in the British Empire in 1931, together with comparative figures of populations for 1921 and 1911, are given in a table at p. 165 of the 1934-35 Year Book.

**Section 19.—Area and Population of the World.**

Statistics showing the areas and the populations of the various continents, and details of each country, as in 1931, are given in a table at pp. 168-169 of the 1934-35 Year Book.

# CHAPTER V.—VITAL STATISTICS.\*

		SECTION 4. NATURAL INCREASE.....	140

The collection of vital statistics commenced in Canada, as in England, with the registration of baptisms, marriages, and burials by the ecclesiastical authorities. These registers, maintained by the priests from the first settlement of the country, have made it possible for the vital statistics of the French colony to be compiled from the year 1610.† The system of registration by the clergy was continued after the cession of the country to the British, and was extended to the newly-formed Protestant congregations of Lower Canada by an Act of 1795, but the registration, particularly of births, among these latter remained seriously defective, both in Lower Canada and in the new province of Upper Canada, the pioneer settlers often going out into the wilds far from the authority of government and the ministrations of religion. An early attempt was made to remedy the situation through the census by including a schedule requesting births and deaths for the preceding year, but the efforts made to secure records of births and deaths at the Censuses of 1851 and 1861 produced most unsatisfactory results. Nevertheless, in spite of the inherent unsoundness of securing, at a point of time in a decennial census, a record of births and deaths occurring over a period of time, this method was followed down to 1911, when the obviously untrustworthy character of the results led to the discarding of the data obtained at the inquiry.

In English-speaking Canada, the earlier scheme of registration of baptisms, burials, and marriages by the clergy was succeeded after Confederation by Acts for the enforcement of registration of births, marriages, and deaths with the civil authorities. Such Acts were passed in Nova Scotia in 1864, in Ontario in 1869, in British Columbia in 1872, in Manitoba in 1881, in New Brunswick in 1887, and in Prince Edward Island in 1906. The Provinces of Saskatchewan and Alberta were not established until 1905 and, until provincial Acts were passed after this date, civil registration in these Provinces was governed by ordinances for the Northwest Territories, the first of which was passed in 1888.

The Dominion Government instituted in the early '80's a plan for compiling the annual mortuary statistics of cities of 25,000 population or over, by subsidizing local boards of health to supply the information under special regulations. A beginning was made with the five cities of Montreal, Toronto, Hamilton, Halifax, and Saint John. By 1891 the list had grown to 25, at a time when, in most of the provinces, the only birth and death statistics were those of the municipalities. Upon the organization of provincial bureaus of vital statistics, however, this work was abandoned, though a conference of Dominion and provincial officials, held in 1893, passed a resolution calling upon the provincial and Dominion authorities to

\* This chapter has been revised in the Vital Statistics Branch, Dominion Bureau of Statistics. A list of the publications of this Branch will be found in Chapter XXIX, Sect. 1, under "Population".

† For a summary of the vital statistics of the Roman Catholic population from 1610 to 1883, see the *Statistical Year Book of Quebec, 1921*, English or French edition, p. 51. For details, by years, of this movement of population, see Vol. V of the Census of Canada, 1871, pp. 160-265, and Vol. IV of the Census of Canada, 1881, pp. 134-145.

co-operate in the work of collecting, compiling, and publishing the vital statistics of the Dominion. This resolution had no immediate practical results in securing accurate or comparable vital statistics.

The 1912 Commission on Official Statistics recommended that "for the Dominion, now engaged in building up its national unity, it is important that uniform data should render possible to statisticians the institution of true interprovincial and international comparisons. By effective co-operation of the provinces with the Dominion, this object should be capable of attainment without sacrificing the liberty of each province to satisfy its own special statistical requirements". Yet, prior to 1920, it was impossible to compile any satisfactory series of vital statistics figures for Canada as a whole. Among the obstacles to such a national compilation were the inequalities of registration between the provinces, the lack of uniformity in classification and in the method of presentation, the omission in some cases of important data, the choice in some cases of the fiscal instead of the calendar year as the unit of time, and the fact that for some of the provinces within comparatively recent years the series of publications was broken, while for New Brunswick no provincial vital statistics at all were published from 1895 until 1920.

Co-operation was finally effected as a consequence of the establishment of the Dominion Bureau of Statistics under the Statistics Act of 1918, which specifically provided that the Bureau should publish an annual report on vital statistics. A scheme was first drawn up in the Bureau and submitted to the various provinces; then Dominion-Provincial conferences on vital statistics were held in June and December, 1918, when final discussions took place.

In 1919, as a result of conference, a plan was devised whereby the Bureau of Statistics and the Registrar General's office in each province would co-operate in producing national vital statistics for the Dominion. Under this national system, while registration of births, marriages, and deaths, is carried out as heretofore by the provincial authorities, the legislation of each province conforms in its essentials to a model bill, prepared by the Dominion Bureau of Statistics, one of the features of which was compulsory registration. The Bureau of Statistics undertakes compilation and tabulation.

Under the scheme outlined above, the vital statistics for all the provinces except Quebec were secured and compiled on a uniform basis for the years 1921 to 1925. The annual reports for these years may be obtained on application to the Dominion Statistician.

Quebec has been included in the registration area as from Jan. 1, 1926, from which date her statistics are on a comparable basis with those of the other provinces. The final reports for 1926 to 1937, including the statistics of all the nine provinces, may be procured from the Dominion Statistician, with the exception of the report for 1931, which is out of print.

Two important considerations should be borne in mind by the student who uses either the tables that follow or the detailed reports issued by the Bureau of Statistics for comparative purposes. First, in spite of the improvements of the past decade, registration generally, and the registration of births in particular, is not as yet universally carried out. Secondly, the very considerable differences in the age and sex distribution of the population in different provinces make comparisons of crude birth rates and crude death rates, as among the provinces, unfair and misleading. All rates in this chapter have been recalculated on the basis of the revised estimates of population given at p. 103.

The Vital Statistics Branch has inaugurated a series of reports classifying vital statistics in Canada by place of residence. The first report, based on 1935 figures, was published in 1938 and the report based on 1936 figures was issued in 1939. These reports show: (1) births according to residence of mother; (2) deaths according to place of residence and place of occurrence for cities and towns of 5,000 population or over, and for the remaining parts of counties or census divisions; (3) deaths according to residence and cause of death, by provinces; (4) the same information as in (3) for cities of 40,000 population or over; (5) the same information for places of 5,000 population or over but under 40,000. Deaths according to residences and causes for counties and census divisions, exclusive of places of 5,000 population or over are also given and the 1936 report covers live births, stillbirths, and deaths under one year and under one month. These reports are in three Parts and may be obtained from the Dominion Statistician, price 25 cents for each Part.

**Yukon and the Northwest Territories.**—The vital statistics of Yukon and the Northwest Territories have been collected and compiled since 1924. They are not, however, presented with those of the nine provinces in the tables of this chapter because the figures are not regarded as complete, the details are in many cases not available, and the small and varying population is not known with sufficient accuracy for each year to enable the rates to be calculated. As these territories contain less than 1/700th of the population of Canada, their vital statistics are a negligible factor in the total. Births, marriages, and deaths in Yukon and the Northwest Territories, for the years 1924-38 are summarized in the following statement.

VITAL STATISTICS OF YUKON AND THE NORTHWEST TERRITORIES, 1924-38.

<sup>1</sup> Preliminary figures.

## Section 1.—Births.

Throughout almost the whole of the civilized world the birth rate has, in the past generation, been on the decline, though the consequent reduction in the rate of natural increase has been partly offset by the synchronous decline in the death rate.

The crude birth rate of England and Wales, for example, was 35.4 per 1,000 population for the average of the decennium 1871-80, 32.5 in 1881-90, and 29.9 in

1891-1900. In 1913 the birth rate was 24.1, and, though it rose to 25.5 in 1920, it has fallen quite rapidly, with minor fluctuations, to 14.9 in 1937.

Similarly, in France the crude birth rate declined from an average of 25.4 per 1,000 population in the 1870's, 23.9 in the 1880's and 22.2 in the 1890's to 21.4 in 1920, 16.1 in 1934, and 14.7 in 1937. In Germany, again, the crude birth rate was 39.1 in the 1870's, 36.8 in the 1880's, 36.1 in the 1890's, 25.9 in 1920, 17.6 in 1930, and 14.7 in 1933. Since then the rate has recovered to 18.8 in 1937.

In Canada the crude birth rate still stands at a comparatively high figure, being 20.5 per 1,000 in 1938. This, however, is due largely to the influence of Quebec, where the rate, although declining, stood at 24.6 per 1,000 in 1938, as compared with 17.6 per 1,000 in Ontario. In the other provinces the figures varied from a low of 16.4 in British Columbia to a high of 25.7 in New Brunswick.

Birth statistics are given by sex in Table 1, below. Table 2 gives the number of live births in cities and towns of 10,000 population or over for the years 1934 to 1938, inclusive. For some years previous to 1930 there was a definite tendency for such births to increase but the figures from 1930-36 indicate an opposite trend; since 1936, however, an increase of trend again has been apparent.

**Sex of Live Births.**—Table 1 shows the numbers and proportions of live male and female births reported for each province of Canada during the calendar years 1936, 1937, and 1938, with averages for the five-year periods 1921-25, 1926-30, and 1931-35. The figures for Quebec commence only with the year 1926, when that province entered the registration area, and the totals for Canada are limited in the same manner in consequence. Every province shows an excess of male births for the years or averages shown in the table. The table shows that among every 1,000 born in 1938 in the whole of Canada, 514 were males and 486 females. In other words, there were 1,056 males born to every 1,000 females.

### 1.—Live Births by Sex, and Ratio of Males to Females, by Provinces, 1936-38, with Averages, 1921-25, 1926-30, and 1931-35.

NOTE.—For corresponding figures for single years 1921-25, see p. 165 of the Canada Year Book for 1927-28, for those for 1926-30, p. 156 of the Canada Year Book for 1933, those for 1931-33, p. 156 of the 1936 Year Book and those for 1934-35 at p. 159 of the 1938 Year Book.

<sup>1</sup> Includes East Windsor, Sandwich, and Walkerville.<sup>2</sup> Census of 1936.

**Nativity of Mothers.**—Table 3 shows, by provinces, the percentages of legitimate children born alive to Canadian-born, British-born, and foreign-born mothers, respectively, for the years 1936, 1937, and 1938. The influence of the limited immigration in recent years is reflected in the figures. In the Prairie Provinces of Manitoba, Saskatchewan, and Alberta, where the percentages born to foreign-born mothers in 1933 were 25.9, 36.3, and 40.4, respectively, they were 16.4, 23.9, and 27.7, respectively, in 1938. Thus more and more of the children of the West are coming within the class of third generation Canadian.

**Fertility Rates.**—The crude birth rate of a young country is subject to influences that vitiate comparison with older lands. These influences are the result, to some extent, of differences in age or sex constitution or in conjugal condition. For this reason birth rates are frequently based on the number of births per thousand women within suitably-chosen age groups. Such rates are commonly known as fertility rates. At pp. 150-152 of the 1936 Year Book specific fertility rates of married women between the ages of 15 and 49 years are given, by provinces, for 1921, 1922, and 1930-32. Such statistics will not again be compiled until 1941 census data are available.

**Multiple Births in Canada.**—During the thirteen-year period 1926-38, out of a total of 3,044,777 recorded confinements, 36,641 or one in 83.1 were multiple confinements. Of these 36,280 were twin and 359 were triplet confinements, while one, in British Columbia in 1931, was a quadruplet confinement from which all the children died within a few hours of birth. A multiple confinement resulted in the birth of the Dionne quintuplets on May 28, 1934. In 1937 there were 2 quadruplet confinements in Quebec, all children being born alive.

Table 4 shows the incidence of multiple births in each year from 1934 to 1938. In 1938 one in every 87 confinements was a twin confinement, a proportion that is fairly representative for the other years as well. There were only 22 triplet

confinements in 1938. Of the children born alive or dead, one in every 43 resulted from a multiple confinement. For children born alive the proportion was one in 45 and for children stillborn one in 22. In the multiple confinements stillborn children formed 5.5 p.c. of the total births as against 2.7 p.c. in single confinements.

#### 4.—Live Births and Stillbirths Classified as Single and Multiple, by Sex, 1934-38.

NOTE.—For statistics from 1926 to 1933, see p. 162 of the 1938 Year Book.

born alive (five males and three females).

<sup>2</sup> Including two sets of quadruplets, all

**Ages of Parents.**—Table 5 shows the age distribution of married fathers and mothers in 1926 (the first year for which the figures are available for the whole of Canada) and for 1935 to 1937. The fathers and mothers in each of these years are arranged according to age and then divided into four equal groups. Each point of age at which a separation comes is called a quartile. To obtain these points of age it is assumed that those in the same year of age are evenly distributed from its lower to its upper limit. In similar manner the deciles divide fathers or mothers in each year into ten equal groups.

In 1937 one-quarter of the married fathers were under 27.85 years of age, one-half under 32.35 years and three-quarters under 38.05 years. One-quarter of the married mothers were under 24.00 years of age, one-half under 28.20 years and three-quarters under 33.38 years. Nine-tenths of the fathers were under 43.83 years and nine-tenths of the mothers under 38.07 years. It will be noted that in every case for fathers, the 1926 figure is appreciably greater than that for 1937. In other words, parents, generally speaking, are somewhat younger than in 1926, although for brief intervening periods the trend has been reversed.

### 5.—Quartile and Decile Ages of Married Fathers and Mothers, in Canada, 1926, and 1935-37.

Position in Array, by Age.	Fathers.				Mothers.

**Birthplaces of Parents.**—Table 6 classifies the children born in 1926, 1937, and 1938 by country of birth of parents, and furnishes some idea to what extent the coming generation of Canadian born will be the offspring of Canadian-born, British-born, or foreign-born parents. The term "country not specified", under country of birth, includes for the father illegitimate births and births of incomplete record, while for the mother it includes births of incomplete record only. Between 1926 and 1938 the percentage of births for which both parents were born in Canada rose from 61.4 in 1926 to 69.5 and 70.7 for 1937 and 1938, respectively.

### 6.—Numbers and Percentages of Live Births in Canada to Fathers and Mothers Born in Specified Countries, 1926, 1937, and 1938.

NOTE.—Comparable statistics for earlier years, from 1926, will be found in previous Year Books commencing with the 1929 edition.

Country of Birth of Parents.		Numbers of Births with Father, Mother, or Both Parents Born in Specified Country.			Percentages of Births with Father, Mother, or Both Parents Born in Specified Country.

<sup>1</sup> Less than one-tenth of one per cent.

<sup>2</sup> Including Galician and Bukovinian.

<sup>3</sup> This

figure gives the number of children whose fathers and mothers have the same origin. The difference between this figure and the total number of births represents the number of children whose fathers and mothers are of different origins.

<sup>4</sup> This excludes the percentage of mixed parentage, i.e., parents not of the same origin.

**Illegitimacy.**—The ratio of illegitimate to total births is, generally speaking, low in Canada as compared with other countries. The steady increase which is noticeable in recent years is probably due, in some measure, to more complete data.

Out of 220,235 live births in the nine provinces of Canada in 1937, 8,574, or 3.89 p.c., were returned as the issue of unmarried mothers. Figures for 1938 show a total of 229,446 live births, of which 9,228, or 4.02 p.c., were returned as the issue of unmarried mothers. Out of this number, 4,799 were males and 4,429 females—a ratio of 1,084 males to every 1,000 females, as compared with 1,053 males per 1,000 females in 1937, and a general 1938 rate for all live births of 1,056 males to 1,000 females. (See Table 8.)

**8.—Illegitimate Live Births, Classified by Age of Mother, by Provinces, 1938, Percentages to Total Live Births, and Totals of Illegitimate Births, by Sex, 1936, 1937, and 1938, with Averages or Totals, 1926-38.**

**Stillbirths.**—Statistics of the number of children born dead in 1938 are shown below for Canada, according to the status and age of the mother. Stillbirths to unmarried mothers were 3.7 p.c. of total illegitimate births in 1938, whereas total stillbirths were only 2.7 p.c. of total births in the same year.

**9.—Stillbirths, Classified by Age of Mother, by Provinces and Legitimacy of Child, 1938, with Averages or Totals, 1926-38, and Ratios to Totals, 1936-38.**

## Section 2.—Marriages and Divorces.

### Subsection 1.—Marriages.

The marriage rate in modern countries of the western world is appreciably influenced by the general level of prosperity prevailing. Marriages in such English-speaking countries, for instance, as the United Kingdom, the United States, Canada, and Australia tend to increase in 'good times' and to diminish in 'hard times', when great numbers of those who are contemplating marriage are led to postpone the event. Thus an examination of the figures for individual years over the past decade clearly shows that marriages reached a peak in 1929 after which the recession was steady and marked until 1932; for 1933 there was an improvement, though of little more than 2 p.c. over 1932, for 1934 a further improvement of over 14 p.c. was recorded and the improvement continued from 1935 to 1938. This general trend for Canada as a whole was followed in the figures for most provinces. For 1938 as compared with 1937 there were decreases shown in Nova Scotia, New Brunswick, and British Columbia, but there were slight increases for Manitoba, Saskatchewan, and Alberta.

Summary statistics of marriages and marriage rates, 1936-38, with averages for 1921-25, 1926-30, and 1931-35, are given in Table 13, p. 119 and in Table 32, p. 141.

**Age at Marriage.**—The average age of all bridegrooms in the Dominion in 1937 was 29.3 years and that of all brides 25.2 years. The average excess of the bridegroom's age was thus 4.1 years. It may be noted in Table 11 that when the contracting parties are grouped by age of bridegroom, the average difference in age is less for the younger groups, grooms under 20 being 0.4 years younger than the brides, while the excess of the average bridegroom's age was 1.5 years in the group

20-24, and steadily increased for each quinquennial age group until it was 11.3 years for the bridegrooms 50 years or over in 1937. On the other hand, when the parties are grouped by the age of the bride, the same regularity is not shown. In the case of brides in the age groups 25-29 years and 30-34 years, the bridegrooms approximate most closely in age to their brides. Since these tables are based upon all marriages contracted during the year, the figures given should not be understood to signify the average ages at first marriage. Out of each 1,000 bridegrooms in 1938, 942 were bachelors, 48 widowers, 10 divorced men; out of each 1,000 brides, 960 were spinsters, 31 widows, 9 divorced women. The first year in which as many as 1 p.c. of those marrying had previously been divorced was 1928. The comparison between the figures of divorces granted, as shown in Table 15 of this chapter, and the number of divorced persons re-married is of some interest. Thus 1,870 divorces were granted in 1938, while 887 divorced males and 789 divorced females married again. This, of course, does not mean that these were the same persons. Table 12 gives the average ages of brides and grooms by provinces.

#### 11.—Differences in Ages of Bridegrooms and Brides, 1937.

Age Group of Bridegrooms.	Average Age of Bridegrooms.	Average Age of Brides.	Excess of Average Age of Bridegrooms.	Age Group of Brides.	Average Age of Brides.	Average Age of Bridegrooms.	Excess of Average Age of Brides.

Canada (exclusive of the Territories).....	29.1	25.0	4.1	29.3	25.2	4.1

**Nativity of Brides and Bridegrooms.**—The majority of marriages contracted in the western provinces in past years were between persons born outside Canada. This condition, however, is being quickly changed and such percentages in all the western provinces show a general reduction over the past few years. (See Table 13.) Both Canadian-born brides and bridegrooms are now in the majority in each province and in the Maritime Provinces and Quebec they show a marked predominance. Taking Canada as a whole, over 83 p.c. of all grooms and over 89 p.c. of all brides in 1938 were born in Canada; these are the highest percentages shown for the period covered by the statistics

### 13.—Percentage Distribution by Nativity of Persons Married in Canada, by Provinces, 1936, 1937, and 1938, with Averages for 1921-25, 1926-30, and 1931-35.

NOTE.—For figures for single years 1921-25, see the 1929 Year Book, p. 166; for 1926-30, the 1933 Year Book, pp. 163-164; for 1931-35, the 1936 Year Book, p. 164; and for 1934-35, the 1938 Year Book, p. 170.

<sup>1</sup> In the United States 1932 was the latest year for which the rate has been computed.

### Subsection 2.—Divorces.\*

For many years subsequent to Confederation the number of divorces granted in Canada was very small, 1883, with 13 divorces, being the first year in which the number attained two figures, while 1903, with 21 divorces, was the record year up to that time. Thereafter the numbers grew more rapidly, 1909 showing 51 divorces and 1913, the last pre-war year, 60 divorces. This number was, however, less than one per 1,000 of the marriages contracted in Canada in these years.

One effect of the War of 1914-18 was to increase divorce. The causes were the generally unsettling psychological influences of the war period, and the long separations between men on active service and their wives. The provision of new facilities for divorce is also to be considered; owing to a decision of the British Privy Council, divorces in the Prairie Provinces, have, subsequently to 1918, been granted by the courts of these provinces, so that Ontario and Quebec have since then been the only provinces in which the applicant for divorce must secure a special private Act of Parliament. In 1930, however, an Act of the Dominion Parliament (20-21 Geo. V, c. 14) gave jurisdiction in divorce cases to the Supreme Court of Ontario.

The above-mentioned causes tended to increase the number of divorces granted in Canada, which grew steadily from 114 in 1918 to 873 in 1930. The numbers

\* The Dominion Bureau of Statistics publishes a bulletin on Divorce showing the sex of applicants and the number of persons re-married, together with comparisons with certain other countries.

are those of final decrees, which alone really constitute divorces. In 1931 the number decreased to 692, this being due largely to the transfer of jurisdiction in Ontario divorces from the Parliament of Canada to the Supreme Court of the Province, with the consequent delay between the granting of the decree *nisi* and the decree absolute. Since 1931 there has been an increase of 193 p.c. in the total number of divorces granted. In 1939 the number passed the two-thousand mark for the first time, owing largely to the increase in British Columbia, where divorces granted almost reached the record established in 1937.

### 15.—Divorces Granted in Canada, by Provinces, 1918-39.

NOTE.—In consequence of a decision of the British Privy Council, divorces in Manitoba, Saskatchewan, and Alberta have, subsequently to 1918, been granted by the courts of these provinces. For divorces in each year prior to 1918, see the 1921 Year Book, p. 825.

## Section 3.—Deaths.

Within the past century, and more especially within the past generation, there has occurred throughout the countries of the white world a notable decline in the death rate, except where man has brought death upon himself through wars and the aftermath of wars. How far this decline has been due to advances in medical science, how far to better sanitation, and how far to the improvement in the general conditions of living, as a result of the increase in the productive power of humanity, is in dispute, but concerning the facts there is no doubt.

Perhaps the most impressive testimony regarding this decline in the death rate is furnished by the mortality statistics of Sweden, where vital statistics have been kept with great accuracy for the whole nation ever since 1750. There, the crude death rate declined from an average of 27.4 per 1,000 in the decade 1751-60 to 14.3 in the decade 1911-20 and to 11.8 in 1938.

Similarly, in England and Wales, the crude death rate, which was 22.5 per 1,000 in the 60's, 21.4 in the 70's and 18.2 in the 90's of the past century, declined to 15.4 in the first decade of the present century and 12.1 in the third; it was 12.4 in 1937. In Scotland, again, the average rate was 22.1 in the '60's, 21.8 in the '70's, 18.6 in the '90's, 13.9 in 1921-25, 13.6 in 1926-30, and 13.9 in 1937.

There will always be years of specially high mortality, for instance 1918, when the death rate in Ontario, the most populous of the provinces of Canada, was 15.3 per 1,000, owing to the influenza-pneumonia epidemic, as against 12.0 in 1917 and 11.9 in 1919. Over a period, however, these abnormalities are reduced to negligibility, and it remains generally true that from decade to decade there is a decline in the crude death rates of the countries of the white man's world.

As for Canada, while the period elapsed since the introduction of complete and comprehensive vital statistics in 1920 has been too short to establish a definite downward trend, the rate of 12.4 per 1,000 for that year, in the eight provinces then included in the registration area, was substantially higher than in any subsequent year. A decided improvement is shown in the deaths and death rate of Quebec for the years 1933-36, although for 1937 the rate increased to 11.3; for 1938 it has dropped to 10.3. On the whole, however, improvement has been in evidence since 1926, and latterly Quebec has shown a lower rate than any of the provinces farther east.

### Subsection 1.—General Mortality.

As shown in Table 32, p. 141, the absolute number of deaths and the death rates for Canada were lower for 1938 than for either of the two previous years. The death rate was 9.5 for 1938 which was a very definite improvement over the 10.2 of the previous year. Decreased rates for 1938 were common to all provinces, Prince Edward Island and New Brunswick showing the greatest improvement.

**Age Distribution of Decedents.**—The numbers and percentages of males and females dying in the nine provinces in 1937 and 1938 are given by single years of age up to 5 and by quinquennial age groups thereafter in Table 16.

The quartile and decile ages of decedents for the years 1926, 1936, and 1937 are given for the two sexes combined and for each sex in Table 17. The fifth decile and second quartile (or the median) both mark the middle points of the arrays, and the deciles, dividing each half into five groups, give a more detailed picture of the age distribution in each half than do the quartiles. It is shown very definitely that the average ages of decedents have been increasing steadily. The method of construction and interpretation of this table is given on p. 111 in connection with a similar one showing quartile and decile ages of married fathers and mothers.

**Standardized Death Rates.**—While the crude death rate gives the actual mortality per 1,000 of population, the differing age constitution of the population in different communities and the high mortality among infants and elderly people make the crude death rate no true test of the relative expectation of life in such

communities. Where the age constitution of a particular group is especially favourable to low mortality, for example among the selected lives of soldiers in peace time, the crude rate will naturally be lower than elsewhere.

When comparisons of the rates of mortality in several communities are made by age groups the effects of differences in age constitution between these communities are eliminated, but by a process that does not bring together and express completely as a single figure the facts of the situation. It has therefore been considered desirable to adopt a particular community as a standard, and to find what the death

rates of other communities would have been if the age and sex constitution of their population had corresponded to those of the community taken as a standard. The 'standard' population chosen for this purpose in England and Wales and the United States is the "standard million", based on the age and sex distribution per million of the population of England and Wales at the Census of 1901. That age and sex distribution was as follows:—

Age Group.	Both Sexes.	Males.	Females.
All ages.....	1,000,000	483,543	516,457
Under 5 years.....	114,262	57,039	57,223
5-9 years.....	107,209	53,462	53,747

35-44 years.....	122,849	59,394	63,455
45-54 years.....	89,222	42,024	46,298
55-64 years.....	59,741	27,913	31,828
65-74 years.....	33,080	14,691	18,389
75 years or over.....	13,581	5,632	7,949

Regarding the standard million of England and Wales the Registrar General says: "As the population of this country in 1901 included relatively few infants and old people it forms a standard exceptionally favourable to low mortality".

The process above described has been applied to the population of the eight provinces, the former registration area of Canada, for the years 1921-38 and to the population of Quebec for the years 1926-38 in Table 18. Of the rates there given, those for 1921 and 1922 have been calculated directly, the proportion of the population in each sex and age group according to the Census of 1921 being assumed to hold true for 1922 also; similarly the rates for 1930, 1931, 1932, etc., have been calculated directly from the proportions shown in each sex and age group at the Census of 1931. For the intervening years, 1923-29, for which estimates of total population but not of population by age groups were available, the following method was adopted. The proportions which the standardized rates of 1921 and 1922 (correct to three decimal places) bore to the crude were averaged, similarly those of 1930 and 1931, and the change was assumed to have taken place in an arithmetical progression during the intervening seven years. Quebec not having been in the registration area in the year 1921, a standardized rate was not available for that year or for 1922, but as the proportion of the standardized rate to the crude depends primarily on the sex and age distribution of the population, and as this distribution was known for 1921 and 1931, and the actual proportion of standardized rate to crude rate for 1931, it was possible to compute a theoretical proportion for 1921. The same method was followed for the total of the nine provinces. The rates for 1933-38 have been computed on the assumption that the arithmetical progression, to which reference has been made, continued over those years in all provinces with the exception of the Prairie Provinces, for which the data of the 1936 Census were used.

In all of the eight provinces for which 1921 figures are given the proportion of the standardized rate to the crude was higher in 1921 than in 1931; in other words, the age distribution had become more unfavourable in the later year. In the Maritime Provinces, Quebec, Ontario, Manitoba, and British Columbia the process of 'standardizing' the death rate results in a reduced rate. This is particularly true of Prince Edward Island and Nova Scotia. In Saskatchewan and Alberta, on the other hand, the standardized rates are generally higher than the crude.

The crude and standardized rates given for recent years, especially 1936, 1937, and 1938, in Table 18, should be accepted with some qualification as will be seen from the method used in their calculation explained above.

<sup>1</sup> Quebec was not included in the registration area prior to 1926.

**Causes of Death.**—Nearly 87 p.c. of deaths recorded in Canada in the years 1934 to 1938 were due to the 32 specific causes named in Tables 19 and 20. In these tables and in the chart on p. 127 the groupings are in accordance with the revision of the International List in 1929. This revision was applied to Canadian vital statistics commencing with the year 1931. Special difficulties in preserving continuity are introduced with each revision of the International List. In the chart on p. 127, for instance, it would be necessary to construct the graphs for diseases of the heart, arteries, and early infancy according to the revisions of 1920 if comparisons were to be made for the years 1926 onwards. On the other hand, this would not give a true picture according to the most recent revision, and therefore the graphs have been constructed for the years 1931 to 1937 on the basis of the revision of 1929.

The changes made according to this revision are: (1) diseases of the coronary arteries, which were included with diseases of the arteries in the 1920 revision, are now included with diseases of the heart; (2) embolism and thrombosis of the coronary arteries, not included with either heart or arteries in 1920, are now included with diseases of the heart; (3) athrepsia was included with "diarrhoea and nethrepsia" in the 1920 revision, but these causes of death are now included with diseases of early infancy.

In any analysis of the relative importance of the causes of death it must be remembered that the Canadian population is an ageing one—that is, the average age is being advanced year by year due to the long-term influences of a falling birth rate, falling specific death rates, and very limited immigration. Since 1913 immigration has been very much curtailed and its effect on age distribution of population is illustrated by the movement of what may be termed the "immigration hump" (that increment of population due to extensive immigration before 1913). This is

gradually passing up the age scale. Further, due to the improvements in sanitation and health conditions generally, the average age at which death takes place has been pushed gradually higher. All these factors tend to thrust those causes that are commonly associated with advancing years to the fore.

Some of the effects of the ageing of the population can be observed by the comparison of crude and standardized mortality rates for individual causes of death in 1921 and 1931, since standardized rates are calculated in order to eliminate the effects of changes in sex and age composition of the population. Cancer provides a pronounced example of the ageing effect. The crude rate for cancer was 75.3 in 1921 and in 1931 it was 95.8. The increase was thus 27 p.c. The standardized rate, however, was 72.7 in 1921 and 81.4 in 1931, an increase of only 12 p.c.\* It may be stated, therefore, that roughly more than half of the increase in the crude cancer death rate between 1921 and 1931 was accounted for by the ageing of the population. Nevertheless, cancer shows a persistent increase over the years in spite of all efforts to control its spread. Diseases of the heart and arteries are two other important causes that affect people of advancing years and that have shown substantial increases. In the case of diseases of the heart, the crude rate showed an increase of 25.5 p.c. between 1921 and 1931, but, again, the standardized rate increased by only 9 p.c.\* The crude rate for diseases of the arteries advanced by no less than 71 p.c. and the standardized by 50 p.c.\* over the decade. For nephritis, a disease that falls in the same general class, the increase in the crude rate was 28.5

\* More accurate diagnosis should not be overlooked as a factor in changing death rates from these diseases.

### 19.—Deaths in Canada, by Principal Causes, 1934-38.

<sup>1</sup> The numbers given in this column refer to the International List of Causes of Death, as revised in 1929 by the International Commission on the Classification of Diseases and Causes of Death. This classification, in its detailed, intermediate, or abridged form, is accepted in almost all civilized countries.

## DEATH RATES PER 100,000 POPULATION

IN  
CANADA

1926-1938

(EXCLUSIVE OF THE NORTHWEST TERRITORIES AND YUKON)

## EIGHT IMPORTANT CAUSES OF DEATH

RATES PER 100,000

\*See text under "Causes of Death"

p.c. and in the standardized, 12.5 p.c.\* Pneumonia is particularly fatal among those of advanced years and among infants; the same influences as have been mentioned have, no doubt, affected the figures for this disease.

### 20.—Death Rates per 100,000 Population in Canada, by Principal Causes, 1934-38.

	<b>Totals, Death Rates per 100,000 Population.....</b>	<b>939.7</b>	<b>966.6</b>	<b>971.9</b>	<b>1,024.9</b>	<b>954.1</b>

<sup>1</sup>For footnote, see end of Table 19, p. 126.

**Deaths in Canadian Cities.**—Deaths in Canada as a whole declined steadily for the period 1931-34, but for 1935, 1936, and 1937 there were substantial increases. The figure for the latter year was 113,824, over 9,000 more than for 1931. For 1938 there was a noticeable reduction to 106,817—only 2,300 more than for 1931. The total deaths of the 67 cities listed in Table 21 show a slightly increased proportion to population for the five-year period 1931-35 as compared with 1926-30. For 1932, which marked the depth of the economic depression, the deaths in these cities increased, thus going against the general trend for Canada; for other years, however, the general trend was followed.

\* More accurate diagnosis should not be overlooked as a factor in changing death rates from these diseases.

**Deaths by Place of Residence.**—The Vital Statistics Branch of the Dominion Bureau of Statistics, has published a report showing deaths by places of residence, (see p. 106).

<sup>1</sup> Census of 1936.

**Crude Death Rates of Different Countries.**—Table 22 shows the crude death rates of various countries for the latest available years. Those of the provinces of Canada are also given for comparison. The Netherlands, New Zealand, Australia, and the Union of South Africa (Whites), are the only countries with death rates under 10.0 per 1,000 of population. The low death rates in the Prairie Provinces are, in all three cases, due in part to a favourable age distribution of population.

**22.—Crude Death Rates of Various Countries and of the Provinces of Canada in Recent Years.**

Subsection 2.—Infantile Mortality.

In recent years a great part of the energy devoted by the medical profession and sanitarians to effect a decline in the death rate has gone to reduce infantile mortality, and in this field a large measure of success has been attained. In Canada, the Dominion, Provincial, and municipal health authorities have all taken part in the struggle to reduce infantile mortality, and usually, in the absence of epidemics, statistics show an improvement each year. In the eighteen years for which figures are available there is evident a very considerable decline in infantile mortality. Figures for 1938 show the lowest rate since the system was established, viz., 63 per thousand live births. In 1921 the infant death rate for Canada (using figures from provincial sources for Quebec) was 102 per 1,000 live births. Table 23 gives figures for the whole of Canada for the years 1931 to 1938 and averages for the five-year periods 1921-25, 1926-30, and 1931-35. Quebec with a rate of 83 has the highest rate of all provinces for 1938. But a study of the Quebec rates shows that steady improvement has been made in the twelve-year period during which the Province has been included in the registration area and 1938 figures show a decrease of over 1,000 as compared with 1937. In Canada as a whole almost 9,000 infant lives were preserved in 1938 which, under conditions prevailing in 1926, would probably have been lost.

23.—Infantile Mortality and Rates per 1,000 Live Births, by Provinces, 1931-38, with Averages, 1921-25, 1926-30, and 1931-35.

<sup>1</sup> Exclusive of the Territories.

<sup>2</sup> Quebec was not included in the registration area prior to 1926.

**Infantile Mortality by Causes of Death.**—Twenty-one principal causes of death accounted in the years 1926 to 1938 for between 90 and 92 p.c. of the infantile mortality experienced in the Dominion, as is shown in Table 24. It is noteworthy

that four causes present at birth, viz., premature birth, injury at birth, congenital debility, and congenital malformations, accounted for over 46 p.c. of the infant deaths of 1938. In 1926 the percentage was 41.4 and in 1930, 42.3, and, since the decline in rate of infant deaths has decreased by 38 p.c. in the interval between 1926 and 1938, great improvement in the post-natal care of infants is indicated. In the years 1937 and 1938, 45.1 p.c. and 50.1 p.c., respectively, of all infants who died were less than one month old, and 32.5 p.c., and 37.4 p.c., respectively, were less than one week old, as is shown in Table 25.

#### 24.—Infantile Mortality in Canada by Principal Causes of Death, 1926, 1937-38.

NOTE.—Figures for the former registration area for the years 1921-25 will be found at pp. 182-183 of the 1927-28 Year Book and figures for the whole of Canada for years from 1926 in the corresponding tables of previous Year Books commencing with the 1932 edition.

<sup>1</sup> Exclusive of the Territories.

**Infantile Mortality in Canadian Cities and Towns.**—In interpreting the statistics of Table 26, it should be observed that a very low rate for any particular year means little, since wide fluctuations from year to year are the rule. Moreover, since maternity hospitals in many urban centres draw patients from surrounding districts, the rates based on place of occurrence are often quite different from rates based on place of residence. This is illustrated particularly in the case of Westmount, where the number of infant deaths under one year by place of occurrence in 1938 was 31, compared with 7 by place of residence. Vancouver has a splendid record among the large cities over the three years. Three Rivers, Sorel, Westmount, Quebec City, and Lévis have all rates of over 100 for 1938, and most of them have high rates over the three-year period. Apart from Vancouver, already mentioned, among the large cities Montreal has recorded steady improvement over the period and Winnipeg and Toronto have very low rates and good records.

The infantile mortality in the cities of Canada has been greatly reduced in the years since the inauguration of Dominion vital statistics. Thus the rate for Toronto has fallen from 90 in 1921 to 48 in 1938, that for Winnipeg from 78 to 37, for Vancouver from 56 to 33, for Hamilton from 88 to 37, for Ottawa from 130 to 61, for London from 92 to 45, for Edmonton from 89 to 40, for Halifax from 135 to 63, for Saint John from 147 to 62. Altogether, in the 13 cities of 40,000 population or over in the former registration area of Canada, there were 41,923 live births in 1921 and 3,833 infant deaths, being a rate of 91 per 1,000 live births. In 1938 in these same cities there were 37,984 live births but only 1,666 infant deaths, or a rate of 44 per 1,000 live births.

**26.—Deaths and Death Rates of Children Under One Year of Age (Exclusive of Still-births) in Cities and Towns of 10,000 or Over, 1936-38, with Averages, 1926-30 and 1931-35.**

**Infantile Mortality in Various Countries.**—The rate of infantile mortality to live births has been greatly reduced in civilized countries by the recent advances in medical science and in sanitation. The low record is held at the present time by New Zealand, where in 1937 the rate of infantile mortality was only 31 per 1,000 live births as compared with 68 in 1905. The Netherlands, Australia, Norway, and Sweden, with rates of 38, 38, 42, and 46 in their latest available year (1937) were next in respect of low infantile mortality (with the exception of Iceland).

As showing the improvement in recent years, it may be stated that the rate of infantile mortality in England and Wales has been reduced from 128 per 1,000 live births in 1905 to 58 in 1937, while the rate in Germany has declined from 196 in 1904 to 64 in 1937. In the Netherlands, again, the rate has declined from 131 per 1,000 live births in 1905 to 38 in 1937.

**Infantile Mortality in Certain Cities of the World.**—It is one of the greatest triumphs of our time that city life is in our day, if not as healthy, yet not necessarily more dangerous to human, especially to infant, life than the average living conditions in the country as a whole.

To give particular examples, the rate of infantile mortality in New York was 38 per 1,000 live births in 1938, as against a rate of 51 per 1,000 for the birth registration area of the United States. In 1936, Berlin had an infantile mortality rate of 61 per 1,000 live births, as compared with 66 for Germany; Paris had a rate of 68 in 1936, compared with a rate of 67 for France. On the other hand, in 1937, London had a rate of 54 compared with 58 for England and Wales.

In Canada, Montreal had, in 1938, an infantile mortality of 73 per 1,000 live births as compared with 83 for the Province of Quebec. Toronto had, in 1936, an infantile mortality rate of 48 per 1,000 live births as against 49 for the Province of Ontario, while Winnipeg and Vancouver had much lower infantile mortality rates than their respective provinces. Over a number of years both Vancouver and Victoria have shown two of the lowest infantile mortality rates in the world.

<sup>1</sup> 1936 rate.

<sup>2</sup> Average annual rate, 1935-37.

**Subsection 3.—Maternal Mortality.**

Of cognate interest with infantile mortality is the important subject of maternal mortality arising out of pregnancy and child-birth. This maternal mortality is shown by Tables 29 and 30 to be at its lowest among mothers under twenty-five years of age.

### 29.—Maternal Deaths in Canada and Rates per 1,000 Live Births, by Age Groups, 1935-38, with Averages, 1926-30 and 1931-35.

NOTE.—Comparable figures for 1926-32 will be found at p. 208 of the 1934-35 Year Book, and for 1933-34 at p. 186 of the 1937 Year Book.

## Section 4.—Natural Increase.

During recent years the rate of natural increase of the population of Canada has declined. In 1921 the rate was 17·8; it declined to 13·3 in 1926 and to 12·2 in 1929. After 1929 there was a temporary improvement but the rates for 1935, 1936, 1937, and 1938—10·6, 10·3, 9·6, and 11·0, respectively—continued the downward trend. Among the provinces the trends generally follow that of Canada as a whole, except in the Maritime Provinces, for each of which the trend is not so regularly downward and has, in fact, been upward since 1934. Quebec shows the

greatest improvement in death rate for the period since 1926. The birth rate is declining here as elsewhere and the rate of natural increase has shown a definitely downward trend, although not so markedly as that of Saskatchewan.

Summary statistics of the births, deaths, and natural increase (births minus deaths) per 1,000 of population are given for the years 1921 to 1938, by provinces, in Table 32. Statistics of marriages are also included in this table for convenience. The Province of Quebec is regarded as having one of the highest rates of natural increase per 1,000 population of any civilized area, although for 1938 New Brunswick had a higher rate. The rate for Quebec was 17.1 in 1931 and, while it has been appreciably reduced in line with common experience, it stood at 14.3 in 1938. Saskatchewan has usually approached Quebec in the matter of natural increase and for the years 1934 and 1935 the rates for this prairie province actually exceeded those for Quebec, although for 1936, 1937, and 1938 they were lower. Alberta followed Saskatchewan in order. In the case of the two western provinces the high rates of natural increase are due to their relatively younger populations and lower crude death rates. The high rates for these provinces brought the averages for Canada up to 10.6 in 1935, 10.3 in 1936, 9.6 in 1937 and 11.0 in 1938, in spite of the fact that the rate for British Columbia, which has always been low, was only 4.4 in 1937 and 6.6 in 1938. The rate of natural increase in 1937 was 14.8 per 1,000 in the Union of South Africa (Whites), 8.2 in New Zealand, 8.2 in Australia, 3.9 in Ireland (Eire), 4.7 in Northern Ireland, 3.7 in Scotland, and 2.5 in England and Wales, so that Canada compares quite favourably with most other British countries.

The rates of natural increase per 1,000 of the mean population for other countries in the latest uniform year are as follows, the figures being for 1937: Netherlands, 11.0; Japan, 13.6; Italy, 8.7; Denmark, 7.2; Germany, 7.1; United States, 5.8; Finland, 6.6; Switzerland, 3.7; Norway, 4.7; Belgium, 2.2; Sweden, 2.3; France, - 0.3.

### BIRTH RATES, DEATH RATES AND RATES OF NATURAL INCREASE

IN CANADA

1926-1938

RATES PER 1000 POPULATION

(Exclusive of the Northwest Territories and Yukon)

### 32.—Births, Marriages, Deaths, and Natural Increase, by Provinces, 1936-38, with Averages 1921-25, 1926-30, and 1931-35.

NOTE.—For other than census years, birth, marriage, and death rates are calculated on estimated population (see p. 103). Figures for individual years 1921-25 will be found at p. 160 of the 1927-28 Year Book; for 1926-30 at p. 150 of the 1933 Year Book; for 1931-33 at p. 147 of the 1936 edition; and for 1934-35 at p. 191 of the 1938 Year Book.

<sup>1</sup> Quebec was not included in the registration area prior to 1926.

**Natural Increase in Cities and Towns.**—Statistics of natural increase in cities and towns of 10,000 population or over are given for the period 1926-38 in Table 33, but these are not worked out as rates per thousand of population, though the census populations in 1931, which are also given, furnish some guide to such rates.

<sup>1</sup> Census of 1936.

**Natural Increase, by Sex.**—In Table 34 the relationship of births to deaths is shown by sex from 1926 to 1938 for Canada and for 1938 by provinces. In spite of higher male births, the natural increase is shown to be lower for males than females due to the higher mortality among the former.

**34.—Births, Deaths, and Natural Increase in Canada,<sup>1</sup> by Provinces and Sex, 1938, with Totals, 1932-38, and Averages, 1926-30, and 1931-35.**

### Section 1.—General Information.

While the great majority of French Canadians can trace their descent to ancestors who left the Old World 250 years ago or even longer, most English-speaking Canadians are comparative newcomers both to Canada and to this continent, though a considerable number of the United Empire Loyalist families had been resident in the old colonies for generations before they moved north to establish English-speaking settlements in what is now the Dominion of Canada. During the middle third of the nineteenth century, a great English-speaking migration entered the Province of Ontario and made it, for the first time, more populous than the sister Province of Quebec, thus bringing about the agitation for representation by population. Thereafter, immigration slackened until the dawn of the twentieth century brought another flood of settlers to the newly-opened territories of the great Northwest, resulting in an increase of population between the censuses of 1901 and 1911 greater than the combined increase of the three decades from 1871 to 1901.

Immigration during the second decade of the twentieth century promised, at its commencement, to be even greater than during the first. In its first three years no fewer than 1,107,914 persons entered Canada for purposes of settlement, but the War of 1914-18 dried up the sources of immigration in the United Kingdom and Continental Europe, where every able-bodied man was needed for the defence of his country. Immigrant arrivals from the United Kingdom in 1917 numbered only about 3,000, as compared with 157,000 in 1913; immigrant arrivals from other countries, except the United States, numbered less than 3,000 in 1915, as compared with approximately 146,000 in 1913. Since the War of 1914-18, immigration to the Dominion has never approached that of the pre-war period.

**Assimilation of Immigrants.**†—A side-light on the question of the assimilation of immigrants is shown by Table 1, the statistics of which are taken from Volume I of the Census of 1931. These figures show the racial origins of the population, by country of birth, and the leading races with which males intermarry. The upper

\* Revised under the direction of F. C. Blair, Director of Immigration, Department of Mines and Resources, Ottawa.

† For further information on this subject, the reader is referred to Census Monograph No. 4, "Racial Origins and Nativity of the Canadian People", which may be obtained from the King's Printer, Ottawa, price 35 cents.

part of the table is interesting inasmuch as it shows the degree to which non-British stocks are becoming basic parts of the population, almost 80 p.c. of the persons of Dutch racial origin, for instance, being now Canadian born.

The lower part indicates the varying tendencies towards intermarriage of persons of different racial origins. By 1931, 37·8 p.c. of the married men and 37·6 p.c. of the married women of Northwestern European origins had married outside their respective stocks, as against 18·4 p.c. of the men and 18·0 p.c. of the women of Southern, Eastern, and Central European stocks. Thus the Northwestern Europeans as a group had intermarried with others to twice the extent of Eastern and Central Europeans. Of the linguistic groups, the Scandinavians had married out to the greatest extent—approximately 54 p.c. for the men and 52 p.c. for the women; the Germanic peoples ranked second with 32 and 33 p.c. Only 25·9 p.c. of the men of Latin and Greek origin had crossed the racial line in marriage and 11·8 p.c. of the women; for the Slavs the figures are 17·6 and 19·4 p.c., respectively. The progress of intermarriage has thus proceeded much further with the Scandinavian and Germanic origins than with the Slavic and Latin and Greek. Many stocks have scarcely intermarried at all.

<sup>1</sup> From racial origins of parents of 1929-31 average of live births.

<sup>2</sup> Not given.

**Expenditures on Immigration.**—From Confederation to Mar. 31, 1939, Canada has spent \$64,922,523 on the encouragement and control of immigration, over 69 p.c. of which was spent in the three decades 1891-1930. Expenditures for the five latest years will be found in the Public Finance chapter of this volume, while yearly details may be obtained from the "Public Accounts", published annually by the Department of Finance.

## Section 2.—Statistics of Immigration.

Immigration to Canada, as to other new countries, is generally greatest in 'boom' periods, when capital as well as labour is leaving the older countries for the newer in order to secure the more remunerative investments generally to be found in virgin territories where the natural resources are still unexploited. In periods of depression, however, the sending abroad of both capital and labour is diminished, both preferring at such times to endure the ills they know at home rather than take the risks of a new adventure at a distance. Indeed, the depression that began about the close of 1929, with its accompanying unemployment and unsold surplus of farm products, raised the question whether it was desirable that Canada should accept immigrants in any considerable number. Therefore, the Government, on Aug. 14, 1930, passed an Order in Council whereby immigrants, except Britishers coming from the Mother Country or self-governing Dominions, and United States citizens coming from the United States, were allowed

to come in only if they belonged to one of two classes—(a) wives and unmarried children under eighteen years of age, joining family heads established in Canada and in a position to look after their dependants; (b) agriculturists with sufficient money to begin farming in Canada. This limitation applies to the whole continent of Europe as well as to many other countries. Regulations affecting immigration from the British Isles, the British Dominions, or the United States have not been changed but a policy of no solicitation has been rigidly adopted. In harmony with this policy the Department of Immigration and Colonization, during 1931, closed all its Canadian Government Information Bureaus in the United States and reduced its representation in the British Isles.

For many years the Immigration Regulations have contained a general provision that immigrants coming to Canada must have sufficient funds to look after themselves until employment is secured. Naturally, when employment is readily available a sum would be considered sufficient that would be insufficient in periods of unemployment, and the enforcement of this regulation is an important factor in reducing immigration at the present time. An Order in Council (Aug. 7, 1929), prohibiting the landing in Canada of any immigrant coming under contract or agreement, expressed or implied, to perform labour or service of any kind in Canada, is also in effect but this prohibition does not apply to farmers, farm labourers, or houseworkers. Under the Order, the Minister of Immigration and Colonization may admit any contract labourer if satisfied that his labour or service is required in Canada.

### Subsection 1.—Growth of Immigration Since Confederation.

The wide fluctuations in the immigration movement since the middle of the nineteenth century are shown in Table 2. The period of heavy movement between 1902 and 1914 was cut down severely between 1915 and 1918. Since 1929 the figures have been the lowest on record for any decade.

#### Subsection 2.—Sex and Conjugal Condition of Immigrants.

**Sex and Conjugal Condition of Immigrants.**—As shown by Table 4, the 17,244 immigrants who came to Canada in the calendar year 1938 included 7,416 males and 9,828 females, males constituting only 43.0 p.c. of the total, as compared with 41.7 p.c. in 1937. Prior to 1932 males normally exceeded females, as shown on p. 213 of the 1934-35 edition of the Year Book, where figures for the fiscal years 1911-34 will be found. Similar information for the calendar years 1929-38 is given in Table 5.

# AGE PYRAMIDS FOR ALL OF STATED AGES SHOWING THE PERCENTAGE DISTRIBUTION OF THE SEXES IN EACH DECENNIAL AGE GROUP FOR THE TOTAL THE NATIVE BORN AND THE IMMIGRANT POPULATIONS IN CANADA 1931 COMPARED WITH 1921

1931

1921

A population produced from its own stock, that is, where there is no immigrant element, and affected by births and deaths alone would, if classified by age groups show regularly decreasing numbers from the lower age group to the higher. Any lowering of the birth rate, however, would lessen the difference between the lower and higher groups. Canada's total population is, however, a composite of immigrant and native; consequently it shows abnormally large proportions in the middle group owing to the age of arrival of most immigrants. In the above chart this middle "bulge" occurs at later middle age groups in 1931 than in 1921 owing to the ageing of those immigrants already in the country, and the curtailment of immigration during more recent years. The pyramids of the native born are also more or less composite inasmuch as they include the children born in Canada from immigrant parents, but the influence is the exact opposite in this case to that mentioned above, for the numbers in the lower age group are the larger. This effect is naturally less pronounced in 1931 for exactly the same reasons that are given for the immigrant population.

**5.—Sex Distribution of Immigrants as Adult Males, Adult Females, and Children, Calendar Years 1929-38.**

Year.	Adult Males.	Adult Females.	Children Under 18.		Total.

1938.....	4,142	6,800	3,274	3,028	17,244

**Subsection 3.—Languages and Racial Origins of Immigrants.**

**Languages of Immigrants.**—At the Census of 1931, only 1·82 p.c. of the population of ten years of age or over was unable to speak either English or French, but the percentages, by racial origins, of those speaking neither official language varied greatly, ranging from less than one-hundredth of one per cent in the case of those of English and Irish origin to 33·96 p.c. in the case of Indians and Eskimos, whose manner of life and remoteness from civilization precludes their becoming conversant with the European languages. Length of residence in Canada is naturally a very important factor in the ability of the immigrant to speak English or French. Immigration of Polish- and Czech-speaking immigrants has been relatively heavy in the past few years and it may, therefore, be of interest to note the standing of these two peoples, at the date of the latest census in so far as their ability to speak English or French was concerned.

In 1931, 13·80 p.c. of the persons of Polish origin were unable to speak either official language. In this connection, it is important to note the percentage of the population of specified origin born on British soil or in the United States, since this profoundly influences the result. In the case of the Poles this amounted to 48·44 p.c., while the average length of residence of immigrants of Polish origin was 12·0 years. In the case of residents of Czech and Slovak origin, the percentage born in British possessions or the United States was lower than that of residents of Polish origin, being 31·90 p.c., and the percentage unable to speak English or French was 14·08. This is largely explained by the fact that the average residence of immigrants of these origins was only 7·9 years. Other factors to be borne in mind are the percentage of illiteracy in the population of any given origin and their residences in rural or urban communities. In the case of the two origins discussed here, the percentages of illiteracy were 11·75 for the Poles and 8·49 for the Czechs and Slovaks. The question of urban or rural residence is complicated by the fact that newly-immigrated persons whose friends and relations are engaged in certain lines of urban work tend to congregate in areas where their mother tongue is commonly spoken and where their opportunities of learning English or French are consequently curtailed, as is found in certain mining and industrial communities, but, on the whole, it is usually considered that the urban resident has a better chance of becoming acquainted with the language of the country than the one who settles in a rural community even where it is not composed largely of those speaking his own mother tongue.

English-speaking immigrants constituted 51 p.c. of the total in 1938 and French-speaking immigrants nearly 4 p.c. Of the immigrants speaking neither of the official languages, Polish-speaking persons constituted 10 p.c. and those speaking Czech were almost as numerous.

<sup>1</sup> Includes those speaking Yiddish.

**Racial Origins of Immigrants.**—Where there is any considerable immigration into a democratic country, the racial and linguistic composition of the immigrants is of great importance. Canadians prefer that settlers should be of a readily assimilable type, already identified by race or language with one or other of the two great races now inhabiting this country and prepared for the duties of Canadian citizenship. Since the French are not, to any great extent, an emigrating people, this means in practice that the great bulk of the preferable settlers are those who speak the English language—those coming from the United Kingdom or the United States. Next in order of readiness of assimilation are the Scandinavians, Dutch, and Germans, who learn English readily and have some acquaintance with the working of democratic institutions. Settlers from Southern and Eastern Europe, however desirable from a purely economic point of view, are less readily assimilated, and the Canadianizing of the people who have come to Canada from these regions in the present century is a problem both in the agricultural Prairie Provinces and in the cities of the east. Less assimilable still, are those who come to Canada from the Orient. On the whole, the great bulk of Canadian immigration of the past generation has been drawn from the English-speaking countries and from those Continental European countries where the population is ethnically closely related to the British, though for some years there was an increasing immigration of Slavs. In the latest year the British races contributed 39.4 p.c. of the immigrants and the French 6.1 p.c.

## 7.—Racial Origins of Immigrants into Canada, Calendar Years 1927-38.

NOTE.—Dashes in this table indicate that no immigrants were reported for the corresponding stub items. Statistics for 1926 will be found at pp. 158-159 of the 1939 Year Book.

## Subsection 4.—Countries of Birth and Nationalities of Immigrants.

**Countries of Birth of Immigrants.**—The figures of Table 8 show that the United States (with 4,474) was the birthplace of more of the 1938 immigrants than any other single country. This has been the case since 1930. In 1938 Poland came second with 2,635, Czechoslovakia third with 2,040, and England fourth with 1,951.

**Nationalities of Immigrants.**—In the calendar year 1938 the percentage of British subjects immigrating to Canada was 27·7, while that of United States citizens was 28·3. In 1930, when total immigration was over eight times that of the latest year, the proportions were 34 p.c. and 21 p.c., respectively. The third largest group, comprising immigrants of Polish nationality, dropped from 16 p.c. in 1930 to 14·9 p.c. in 1938.

### Subsection 5.—Ports of Arrival, Destinations, and Occupations of Immigrants.

**Ports of Arrival of Immigrants.**—Throughout the greater part of Canada's history, Quebec has been the port at which the greatest number of immigrants have landed. Of recent years there has been a tendency for a larger percentage of immigrants to arrive at the Port of Halifax. This would appear to have been due to increasing immigration in the early spring months before the St. Lawrence is open for traffic. Figures for the calendar years 1931-37 are given at p. 164 of the 1939 Year Book. Statistics on a fiscal year basis will be found in the Report of the Department of Mines and Resources.

**Destinations of Immigrants.**—Table 10 shows that in each of the calendar years shown the Province of Ontario continued to receive the largest number of immigrants, as has been the case since 1905. In 1929 and 1930 Manitoba was in second place, while in the nine latest years Quebec stood second as the immediate destination of new arrivals.

#### 10.—Destinations of Immigrants into Canada, by Provinces, Calendar Years 1929-39.

NOTE.—The 1934-35 edition of the Year Book gives similar information, by fiscal years, from 1901 to 1934.

Year.	Mari- time Prov- inces.	Quebec.	Ontario.	Mani- toba.	Sask- atche- wan.	Alberta.	British Colum- bia and Yukon.	N.W.T.	Not Shown.	Total.

It will be noted that the "Other Classes" group is now much the largest of the seven divisions, this being accounted for by the fact that women and minor children now comprise over half of the immigrants coming into Canada. This has been the case since 1930, the women and children now entering the Dominion being chiefly the wives and children of former immigrants, who, if they had entered at the same time as the family head, would have been classified under one of the other divisions of Table 11.

The percentage division of immigrants entering Canada in 1938 was: farming class, 27·6; labouring class, 2·8; mechanics, 5·1; trading and clerical class, 7·7; mining class, 0·3; female domestics, 5·7; and other classes, 50·8. The farming class accounted for over half of the total immigration from 1925 to 1928, reaching 56·9 p.c. in the fiscal year 1927; in the fiscal year 1935 it accounted for only 11·9 p.c. of the total. In the fiscal year 1920, the percentage was 26·7 and in the calendar year 1938 it was 27·6.

Persons classified as belonging to the labouring class have not accounted for more than about 7 p.c. in the past 20 years, the 1920 fiscal year figure being 5·3 p.c. as compared with 2·8 p.c. in the calendar year 1938. The mechanics (skilled tradesman) class has fluctuated between 16·1 p.c. and 5·1 p.c. in the past 20 years, but the percentage has dwindled steadily since 1929. The trading and clerical class reached its highest percentage for the past 20 years in the fiscal year 1934, when the figure stood at 9·7 p.c. In the fiscal year 1920 it was only 3·2 p.c. The mining class has never amounted to more than 2·3 p.c. in the period under discussion.

The female domestic servant class, which now accounts for between 5 and 6 p.c. of the total immigration, showed a percentage of 12·3 in the fiscal year 1931.

Statistics of immigration are now compiled on a calendar year basis, but the series does not extend far enough back to ascertain trends, and the above comparisons are made on the basis of the fiscal years 1920-38.

### Subsection 6.—Rejections of Immigrants.

**Prohibited Immigrants.**—The following is quoted from Section 3 of the Immigration Act.

#### PROHIBITED CLASSES.

"No immigrant, passenger, or other person, unless he is a Canadian citizen, or has Canadian domicile, shall be permitted to enter or land in Canada, or in case of having landed in or entered Canada shall be permitted to remain therein, who belongs to any of the following classes, hereinafter called 'prohibited classes':—

- (a) Idiots, imbeciles, feeble-minded persons, epileptics, insane persons, and persons who have been insane at any time previously;
- (b) Persons afflicted with tuberculosis in any form, or with any loathsome disease, or with a disease which is contagious or infectious, or which may become dangerous to the public health, whether such persons intend to settle in Canada or only to pass through Canada in transit to some other country: Provided that if such disease is one which is curable within a reasonably short time, such persons may, subject to the regulations in that behalf, if any, be permitted to remain on board ship if hospital facilities do not exist on shore, or to leave ship for medical treatment;
- (c) Immigrants who are dumb, blind, or otherwise physically defective, unless, in the opinion of a Board of Inquiry or officer acting as such, they have sufficient money, or have such profession, occupation, trade, employment or other legitimate mode of earning a living that they are not liable to become a public charge or unless they belong to a family accompanying them or already in Canada and which gives security satisfactory to the Minister against such immigrants becoming a public charge;
- (d) Persons who have been convicted of, or admit having committed, any crime involving moral turpitude;
- (e) Prostitutes and women and girls coming to Canada for any immoral purpose and pimps or persons living on the avails of prostitution;
- (f) Persons who procure or attempt to bring into Canada prostitutes or women or girls for the purpose of prostitution or other immoral purpose;
- (g) Professional beggars or vagrants;

- (h) Immigrants to whom money has been given or loaned by any charitable organization for the purpose of enabling them to qualify for landing in Canada under this Act, or whose passage to Canada has been paid wholly or in part by any charitable organization, or out of public moneys, unless it is shown that the authority in writing of the Deputy Minister, or in case of persons coming from Europe, the authority in writing of the Assistant Superintendent of Immigration for Canada, in London, has been obtained for the landing in Canada of such persons, and that such authority has been acted upon within a period of sixty days thereafter;
- (i) Persons who do not fulfil, meet, or comply with the conditions and requirements of any regulations which for the time being are in force and applicable to such persons under this Act;
- (j) Persons who, in the opinion of the Board of Inquiry or the officer in charge at any port of entry, are likely to become a public charge;
- (k) Persons of constitutional psychopathic inferiority;
- (l) Persons with chronic alcoholism;
- (m) Persons not included within any of the foregoing prohibited classes, who upon examination by a medical officer are certified as being mentally or physically defective to such a degree as to affect their ability to earn a living;
- (n) Persons who believe in or advocate the overthrow by force or violence of the Government of Canada or of constituted law and authority, or who disbelieve in or are opposed to organized government, or who advocate the assassination of public officials, or who advocate or teach the unlawful destruction of property;
- (o) Persons who are members of or affiliated with any organization entertaining or teaching disbelief in or opposition to organized government, or advocating or teaching the duty, necessity, or propriety of the unlawful assaulting or killing of any officer or officers, either of specific individuals or of officers generally of the Government of Canada or of any other organized government, because of his or their official character, or advocating or teaching the unlawful destruction of property;
- (p) Persons guilty of espionage with respect to His Majesty or any of His Majesty's allies;
- (r) Persons who have been found guilty of high treason or treason or of conspiring against His Majesty, or of assisting His Majesty's enemies in time of war, or of any similar offence against any of His Majesty's allies;
- (s) Persons who at any time within a period of ten years from the first day of August, one thousand nine hundred and fourteen, were deported from any part of His Majesty's dominions or from any allied country on account of treason or of conspiring against His Majesty, or of any similar offence in connection with the war against any of the allies of His Majesty;
- (t) On and after the first day of July, one thousand nine hundred and nineteen, in addition to the foregoing 'prohibited classes', the following persons shall also be prohibited from entering or landing in Canada: Persons over fifteen years of age, physically capable of reading, who cannot read the English or French language or some other language or dialect: Provided that any admissible person or any person heretofore or hereafter legally admitted, or any citizen of Canada, may bring in or send for his father or grandfather, over fifty-five years of age, his wife, his mother, his grandmother or his unmarried or widowed daughter, if otherwise admissible, whether such relative can read or not, and such relative shall be permitted to enter; for the purpose of ascertaining whether aliens can read, the immigration officer shall use slips of uniform size prepared by direction of the Minister, each containing not less than thirty and not more than forty words in ordinary use printed in plainly legible type in the language or dialect the person may designate as the one in which he desires the examination to be made, and he shall be required to read the words printed on the slip in such language or dialect; but the provisions of this subsection shall not apply to Canadian citizens and persons who have Canadian domicile, to persons in transit through Canada, or to such persons or classes of persons as may from time to time be approved by the Minister;
- (u) Members of a family (including children over as well as under 18 years of age) accompanying a person who has been rejected, unless in the opinion of the Board of Inquiry no hardship would be involved by separation of the family."

The Immigration Act provides for the rejection and deportation of immigrants belonging to the prohibited classes, and also for the deportation of those who become undesirables within five years after legal entry.

### Subsection 7.—Juvenile Immigration.

**Juvenile Immigrants.**—Among the most generally acceptable immigrants of recent years were the juveniles of both sexes, many of whom had been trained by highly accredited British organizations for Canadian life before coming to Canada, the boys being taught the lighter branches of farm work, and the girls instructed in domestic occupations. On arrival in Canada the boys were placed on farms, while the girls were placed either in town or country, but the organizations remained the guardians of the children until they had reached maturity, and, in addition, the children were subject to efficient and recurrent government inspection until each reached the age of nineteen. This inspection was under the control of the Supervisor of Juvenile Immigration.

Under the British Empire Settlement Agreement the term "children" was applied to boys from 14 to 19 years of age and girls from 14 to 17 migrating to Canada under provincial or approved-society auspices. These organizations were assisted by the Oversea Settlement Agreement, which provided free transportation for the boys and girls from the British Isles migrating to Canada under their auspices. On Sept. 23, 1931, the societies concerned were notified that the Dominion Government had decided to discontinue any further assistance of that nature.

**14.—British Juvenile Immigrants, Fiscal Years 1901-39.**

NOTE.—Juvenile immigrants are, of course, included in the total number of immigrants recorded elsewhere.

**Subsection 8.—Oriental Immigration.**

**Oriental Immigration.**—The immigration to Canada of Orientals is fundamentally an economic rather than a racial problem, affecting most of all those parts of the country that are nearest to the Orient and the classes that feel their economic position threatened. A record of Oriental immigration since the commencement of the century is given in Table 15, while Table 15A gives the same information for the calendar years for which it has been possible to compile the figures, viz., 1929 to 1938.

**15.—Record of Oriental Immigrants by Decades, 1901-30, and for Fiscal Years 1931-39.**

NOTE.—Statistics for individual fiscal years 1901-30 will be found at p. 206 of the 1938 Year Book.

*Chinese Immigrants.*—Oriental immigration to the Pacific Coast of North America appears to have commenced with the coming of Chinese immigrants about the time of the discovery of gold in California in 1849, and British Columbia is thought to have received its first Chinese immigrants some time before 1870. The original occupations of these immigrants were laundry workers and domestic servants. As early as 1872 Chinese were employed in the coal mines of the Province and the Legislature was already considering the imposition of a poll tax on Chinese, the same proposition coming up later in the Dominion Parliament with the design of preventing the employment of Chinese labour in railway construction. A Royal Commission was appointed by the Dominion Government in 1884 to investigate Chinese immigration and this Commission recommended the imposition of a head tax of \$10 upon Chinese entering Canada, together with registration and special legislation regulating the entry of Chinese domestic servants. This led to the passage of legislation in 1885 (48-49 Vict., c. 71) providing that thereafter Chinese of the labouring class should be required, as a condition of entering Canada, to pay a head tax of \$50 each. On Jan. 1, 1901 (63-64 Vict., c. 32), this tax was increased to \$100, and on Jan. 1, 1904 (3 Edw. VII, c. 8), after another Royal Commission had reported on this matter, the head tax was further increased to \$500. This tax was paid by all Chinese immigrants except consular officers, merchants, clergymen and their families, tourists, men of science, students, and teachers. In spite of this restrictive legislation, the number of Chinese enumerated at the decennial censuses rose from 4,383 in 1881 to 17,312 in 1901, to 27,774 in 1911, to 39,587 in 1921, and 46,519 in 1931. Of this last number, 43,051 were males and only 3,468 females. Over 58 p.c. of all the Chinese in Canada, viz., 27,139, were residents of British Columbia.

The Chinese Immigration Act of 1923 (13-14 Geo. V, c. 38)\* limited the entry to or landing in Canada of persons of Chinese origin or descent, irrespective of allegiance or citizenship, to the following classes:—

\* R.S.C. 1927, c. 95.

- (a) Members of the diplomatic corps or other government representatives, their suites and their servants, and consuls and consular agents.
- (b) Children born in Canada of parents of Chinese origin or descent, who have left Canada for educational or other purposes, on substantiating their identity to the satisfaction of the controller at the port or place where they seek to enter on their return.
- (c) Merchants as defined by such regulations as the Minister may prescribe; students coming to Canada for the purpose of attending, and while in actual attendance at, any Canadian university or college authorized by statute or charter to confer degrees.
- (d) Persons in transit through Canada.

Classes (c) and (d) are to possess passports issued by the Government of China and endorsed by a Canadian immigration officer.

*Japanese Immigrants.*—Japanese immigration to Canada commenced about 1896, and a total of some 12,000 came in between then and 1900, but at the Census of 1901 the total number enumerated as domiciled in the Dominion was only 4,738; in 1911, 9,021; in 1921, 15,868; in 1931, 23,342—22,205 of these latter being domiciled in British Columbia. The immigration of Japanese was especially active in the fiscal years 1906 to 1908, in which three years a total of 11,565 entered the country. In 1908 an agreement was made with the Japanese Government, under which the latter undertook to limit the number of passports issued to Japanese immigrants to Canada. Japanese immigration has been very restricted since 1929, only 46 Japanese immigrants having entered Canada in the fiscal year 1939.

*East Indian Immigrants.*—The immigration of East Indians, like Japanese, did not become active until the fiscal years 1906-08, when 5,134 arrived (see Table 15, p. 206 of the 1938 Year Book). However, as a consequence of the operation of the Immigration Regulations, East Indian immigration has for years been comparatively small. A resolution of the Imperial War Conference of 1918 declared that "it is the inherent function of the Governments of the several communities of the British Commonwealth that each should enjoy complete control of the composition of its own population by means of restriction on immigration from any of the other communities". However, it was recommended that East Indians, already permanently domiciled in other British countries, should be allowed to bring in their wives and minor children. In the ten fiscal years 1930-39 only 376 East Indians, many of them women and children, were admitted to Canada.

### Section 3.—Emigration and Returning Canadians.

Emigration from Canada is an important factor tending to offset the immigration activities of the past and the movement from Canada to the United States has attained considerable proportions at certain periods. The quota system of immigration regulation, applied by the United States Government against immigrants generally, but not against the Canadian born, had the effect of limiting immigration to the United States and thereby encouraging Canadians to enter that country. No record of this movement had ever been kept by the Canadian Government, and, while its seriousness was recognized, its magnitude, as indicated by the United States returns, was questioned on the ground that these returns did not make allowance for Canadians returning to Canada after a more or less extended period of residence in the United States. The Canadian Department of Immigration and Colonization was convinced that a very considerable return movement was taking place, but, until 1924, no attempt was made to ascertain the exact magnitude

of that movement. In that year immigration officers were instructed to take note of Canadians returning to Canada from the United States after having left Canada to reside in that country. The results are tabulated in Table 17.

Another circumstance that has, in the past, occasioned a considerable movement from Canada to the United States has been the practice of Europeans to enter Canada and declare themselves bona fide immigrants, with the real intention of entering the United States as soon as the quota restrictions would permit them to do so. The tightening-up of the United States regulations *re* persons entering the United States from Canada, and the active co-operation of the Canadian Department of Immigration and Colonization in discouraging this traffic, seem to have effectually met this situation.

Table 17 shows the number of Canadians who had gone to the United States for purposes of permanent residence and who returned to Canada during the period from Apr. 1, 1924, to Dec. 31, 1939.

1931.....	18,503	1,135	714	20,352	1939....	3,572	565	473	4,610

<sup>1</sup> Nine months.

The movement of population between the two countries now appears to be slightly towards the United States. In the U.S. fiscal year ended June 30, 1939, the total movement from Canada to that country was 14,887, made up as follows: immigrants, 10,501; U.S. citizens returning after residence in Canada, 4,233; and persons deported from Canada, 153. The movement towards Canada totalled 9,417, made up as follows: immigrants, 3,898 (of whom 2,933 were U.S. citizens); persons deported to Canada, 1,915; and persons permitted to depart voluntarily to Canada in lieu of deportation proceedings, 3,604. Canadian immigration figures for the same period show 5,463 immigrants admitted to Canada and 4,252 returning Canadians, a total of 9,715. The discrepancy between the two series is probably due to incomplete emigration statistics.

In the past eight years there has also been considerable emigration from Canada to the British Isles. Table 18, taken from the *Statistical Abstract of the United Kingdom*, shows the movement of population between the United Kingdom and British North America from 1924 to 1939. Inasmuch as the movement between the British Isles and Newfoundland is negligible, the table may be taken as presenting a fair picture of immigrant and emigrant movement between Canada and the United Kingdom.

In connection with the annual estimates of population, a study of the movement of population has been made from available data. The results of this study are summarized at pp. 80-81 of this volume.

The classification of returning Canadians shown at p. 174 of the 1939 Year Book was replaced by the one shown below on Apr. 1, 1938, with the result that comparable figures on the old basis are not available for the calendar year 1938. Statistics, by class of travel for the total number of passengers, other than immigrants, are, however, available for that year, and totals have been included in Table 19.

**19.—Returning Canadians and Other Non-Immigrants Entering Canada via Ocean  
Ports, by Class of Travel, Calendar Year 1939, with Totals 1930-38.**

NOTE.—Figures in this table cover transoceanic passengers only. Totals for 1926 to 1934, on a fiscal year basis, will be found at p. 228 of the 1934-35 Year Book.

<b>Totals, 1939.....</b>	<b>11,687</b>	<b>8,877</b>	<b>13,590</b>	<b>34,154</b>

Commencing on Apr. 1, 1938, an enumeration was made of returning Canadians and other non-immigrants entering the Dominion from Newfoundland. Such persons are not included in the figures of Table 19 nor have they been included in similar previously published tables. In the calendar year 1939 Canadians returning after an absence of more than one year numbered 62, of whom 46 were Canadian born, 11 were born in other British countries, and 5 were naturalized with Canadian domicile. Tourists, etc., numbered 7,192 and Canadians returning after an absence of less than one year numbered 2,689, the total of all classes amounting to 9,943 persons.

#### **Section 4.—Colonization Activities.**

Information on this subject is given at pp. 201-202 of the 1936 edition of the Year Book.

## CHAPTER VII.—SURVEY OF PRODUCTION.\*

### CONSPECTUS.

	PAGE.		PAGE.
SECTION 1. LEADING BRANCHES OF PRODUCTION IN 1937 .....	167	SECTION 3. LEADING BRANCHES OF PRODUCTION IN EACH PROVINCE, 1937 COMPARED WITH 1936.....	174
SECTION 2. PROVINCIAL DISTRIBUTION OF PRODUCTION .....	172		

Despite the fact that adverse weather conditions affected a considerable part of the Canadian economy during 1937, a gain of 13 p.c. occurred in the net value of production compared with that of the preceding year. The net value of commodities produced reached \$2,970,600,000, the highest since 1930, compared with a revised estimate of \$2,628,400,000 for 1936. This showing is a striking demonstration of the progress that has been made in the seven years towards diversification and self-sufficiency. Drought, which in past decades would have had even more serious consequences, is entered as a debit item against the increased wealth and purchasing power derived from mines, forests, and manufacturing plants. A factor that augurs well for the future is the backlog of construction that has accumulated over the past nine years; sooner or later this must be released to take care of the normal expansion of population and industry.

The index of wholesale commodity prices advanced from 74.6 in 1936 to 84.6 in 1937, the rise having been dominated by pronounced increases in raw material prices, thereby contributing to a more favourable parity between primary and secondary industries.

While changes in general method prevent precise comparability over an extended period, it is evident that an intermediate peak was reached in 1937. Subsequent price decline implies recession for the year 1938, the drop in the general price index being 7 p.c. Industrial production, as measured by a comprehensive index, declined over 9 p.c. but employment was relatively well maintained, the index receding only 2 p.c. from the level of 1937. The gain in the volume of field crops during 1938, however, was about 37 p.c. and preliminary estimates place the net value of agricultural production at nearly \$50,000,000 above the level of 1937 and with more normal provincial distribution.

**The Definition of 'Production'.—**The term 'production' is used here in its popular acceptance, i.e., as including such processes as the growing of crops, extraction of minerals, capture of fish, conversion of water power into electric current, manufacturing, etc.—in economic phrase, the creation of 'form utilities'. It does not include various activities that are no less productive in a broad and strictly economic sense, such as (a) transportation, refrigeration, merchandising, etc., which add the further utilities of 'place', 'time', and 'possession' to commodities already worked up into form, and (b) personal and professional services, such as those of the teacher and the doctor, which are not concerned with commodities at all, but are nevertheless essential to any civilized society—representing, in economic language, the creation of 'service utilities'.

As showing the importance of these latter activities, it may be pointed out, for comparison with the figures in the accompanying tables, that steam railway

\* Revised by Sydney B. Smith, M.A., Dominion Bureau of Statistics.

gross earnings in 1937, the latest year for which complete statistics of production are available, amounted to \$355,103,271, street railway gross earnings to \$42,991,444, and telephone and telegraph earnings to \$74,699,188, all of which, from a broad point of view, may be considered as production. Further, it may be noted that, according to the industrial classification of the 1931 Census, out of 3,927,230 persons of ten years of age or over who were recorded as gainfully occupied, 306,267 were engaged in transportation activities, 387,434 in trade, 92,340 in finance, and 767,562 in service occupations. While 81,700 of the latter were engaged in custom and repair work, the value of which is included in the survey of production, the value of the production of the remaining 1,471,903 gainfully occupied persons in the four occupational groups just mentioned would not appear to be included to any extent in the survey of production.

**'Gross' and 'Net' Production.**—The values of products are shown under two headings, namely, 'gross' and 'net'. Gross production represents the total value of all the individual commodities produced under a particular heading. Net production represents an attempt to eliminate the value of materials, fuel, purchased electricity, and process supplies consumed in the production process. The net figures, it will be seen, appear chiefly in the case of secondary production or manufactures, though eliminations are also made in certain cases in the primary or extractive industries, as, for example, seed in the case of field crops, and feed in the case of farm animals. On the other hand, such items as fertilizers in the case of field crops, and reforestation in the case of forestry, are disregarded as partaking of the nature of replacement. The cost of fuel and electricity is deducted in accordance with Resolution 23 of the Conference of British Commonwealth Statisticians, 1935, which states: "The term *net output* or *net value of production* should be used to denote the value added in each industry to the cost of the objects used in production, including all materials, whether transformed or not in the industrial processes, and fuel and purchased power consumed, whether used for heating, lighting, or other purposes, but excluding any amount paid to other firms for work given out to be done by them".

**Difficulties in Differentiating between the Branches of Production.**—A survey of production must differentiate between the more important branches and at the same time give a purview of the whole that will be free from overlapping. This is somewhat difficult in view of the varying definitions that attach to industrial groups. For example, brick, tile, and cement are frequently included under "mineral production" as being the first finished products of commercial value resulting from the productive process; they may, however, be classified under "manufactures" in view of the nature of the productive process—either allocation being quite correct according to the point of view. In the summing up, production in such industries is regarded both as primary production and as secondary production, but the duplication is eliminated in the grand totals.

**Basis of Computation for Each Branch of Production.**—The primary industries of agriculture, fishing, forestry, mining, etc., are separated in this statement from the secondary or manufacturing processes. The close association between the two and the overlappings that are apt to occur have already been pointed out. As further explaining the procedure that has been followed in drawing up the tables, the following notes are appended:—

*Agriculture.*—The annual estimates prepared by the Agricultural Branch of the Bureau of Statistics have been accepted as a basis of gross and net. Provincial

distribution of the net has been arranged on the experience of decennial and quinquennial returns. Figures for 1936 were revised in the light of the findings of the Census of the Prairie Provinces of that year.

*Fisheries.*—Gross value is the sum of fish caught and landed, factory output, and value added domestically. Net is the value of fish marketed less fuel, electricity, supplies, salt, containers, etc.

*Forestry.*—An attempt is made to show the extent of operations in the woods, or the products of round or unmanufactured timber as distinguished from the products of milling operations, the latter being limited to the making of first products such as pulp and paper, lumber, lath, shingles, and cooperage stock.

*Fur Production.*—This item is limited to wild-life production. Production of pelts on fur farms is included in the total for agriculture.

*Mineral Production.*—Considerable overlapping exists as between mineral production on the one hand and manufactures on the other. The Bureau presents the detailed statistics of these groups (the chief of which are smelters, brick, cement, lime, etc.) in its reports on mineral production, since their product is the first to which a commercial value is ordinarily assigned. The figure for net production is the industrial total, i.e., the net value of sales. The value of ores used by smelters, cost of fuel, purchased electricity, and process supplies, etc., are added to make up the gross value.

*Electric Power.*—Total revenue, interprovincial sales excluded, is regarded as the gross, and the cost of fuel is deducted to give the net value.

*Construction.*—The total value of work performed is regarded as the gross, and the cost of materials is deducted to obtain the net value.

*Custom and Repair.*—A special tabulation is made, based upon the Census of Merchandising and Service Establishments, 1930. The net value is obtained by deducting the cost of materials and supplies from gross receipts.

*Total Manufactures.*—The figure given for this heading is a comprehensive one including the several items listed with the extractive industries above, though also frequently regarded as manufactures, viz., dairy factories, fish canning and curing, sawmills, pulp and paper mills, and certain mineral industries. This duplication is eliminated from the grand totals shown in the tables, as pointed out in the general note on p. 172.

## Section 1.—Leading Branches of Production in 1937.

Net production signifies the value left in the producers' hands after the elimination of the value of commodities consumed in production, including all materials, process supplies, fuel, and purchased electricity. Confining subsequent analysis to the net value of commodities produced, it is observed that eight of the nine main divisions of industry showed appreciable advances in 1937 over the preceding year. The only exception to the general expansion in net value was in agriculture, which was maintained at \$679,000,000, a decline of less than 0·1 p.c. from the level of 1936. This was due to the rise in prices of farm products during the year, which advance was greater than in any other important commodity group. As a result, farm product prices compared favourably with those of other groups for the first time in eight

years. However, the loss occasioned by the Saskatchewan drought was more than sufficient to counterbalance gains in value made in the production of other provinces, notably Manitoba, Alberta, and British Columbia.

Mining again gave evidence of its dynamic leadership by establishing a new record for the third consecutive year in the net value of its output. It should be noted that since the War of 1914-18 the mining industry has nearly tripled its annual contribution to the net value of Canada's production. In 1937 there was added a net value, after all deductions, of \$373,000,000, a gain of nearly 28 p.c. over the preceding year. The development of base-metal mining deserves special mention. Each of the metals was produced in much greater volume while the volume of gold production was more than double that of eight years earlier.

Operations in the forestry group were greatly expanded in the year under review, with record production in newsprint at higher price levels and increased export trade in lumber. A gain of more than \$52,000,000 or 22.7 p.c. over 1936 was indicated. Substantial advances in forestry employment indexes confirmed the gain in value.

The net value of fisheries showed a minor rise over 1936, when a record salmon catch had been taken. The increase was limited to less than 1 p.c. or \$205,000. The trapping season was much more profitable with a net value of \$10,500,000, or a gain of nearly 14 p.c. over the preceding year.

The electric power industry continued to establish new records in 1937, the net value being over \$140,000,000, an advance of nearly 6 p.c. over 1936. During the past decade the capacity of hydro-electric installations has more than doubled, and mining and other industries are using more and more electricity in their processing work.

The net value of construction completed in 1937 was \$176,000,000, a gain of \$40,000,000 or about 30 p.c. over the preceding year. This was the largest percentage increase registered in any main industrial group. Building material prices also showed an advance of over 11 p.c.

Manufacturing operations gathered momentum during the year, the volume output having been equal to that of 1929. The net value of manufacturing on the revised basis was over \$1,500,000,000 in 1937, a gain of nearly 17 p.c. or \$217,000,000 from the preceding year. A considerable part of the expansion occurred in the production of durable goods and industrial equipment, particularly in the iron and steel and automobile industries.

A revision of the groups under the heading of custom and repair established this industry on a somewhat lower basis than shown for 1936 in the 1939 Canada Year Book, the "custom clothing" group having been considered more germane to a retail trade classification. Accordingly, the net value of custom and repair work in 1937 was placed at \$79,100,000, a gain of 11.5 p.c. over the revised estimate of \$70,900,000 in 1936.

Comparing the growth of primary and secondary industries, it is observed that the primary group registered a net advance of 10.3 p.c. in 1937 over 1936, compared with a net increase of 17.7 p.c. for secondary production. The official price index of producers goods reached 75.8 in 1937 compared with 72.4 in 1936, whereas the index of consumers goods moved forward to 77.2 from 74.7, indicating a closer approach to a price parity between the two great branches of the national economy.

## 1.—Gross and Net Values of Production in Canada, by Industries, 1936 and 1937.

Division of Industry.	1936. <sup>1</sup>		1937.		Percentage Change in Net Value, 1937 from 1936.	Percentage of Net Value by Industry to Total Net Production 1937.

Totals, Secondary Production <sup>4</sup> .....	3,360,993,214	1,496,373,834	4,088,100,614	1,761,709,546	+17.7	59.30 <sup>4</sup>
Grand Totals.....	4,862,126,049	2,628,419,977	5,658,877,071	2,970,617,510	+13.0	100.00

<sup>1</sup> Revised since the publication of the 1939 Year Book. In conformance with Resolution 23 adopted by the Conference of British Commonwealth Statisticians of 1935, the cost of fuel and purchased electricity was deducted from the gross value of all industries for 1936 and 1937. This is in addition to the deduction for cost of materials and process supplies.

<sup>2</sup> Comprises mineral production, as shown in Chapter XII, Table 1, plus the value of ores and other raw materials of the smelting industry. <sup>3</sup> Includes dairy factories, sawmills, pulp and paper mills, fishcanning and curing, and certain mineral industries, which are also included in other headings above. This duplication, amounting in 1936 to a gross of \$658,618,641 and a net of \$248,214,552 and in 1937 to a gross of \$830,881,358 and a net of \$313,225,585, is eliminated from the grand total.

<sup>4</sup> Includes duplication mentioned in footnote <sup>3</sup>. The percentage of the net manufactures *n.e.s.*, to the total net production in 1937 was 40.17.

Manufactures, <i>n.e.s.</i> .....	1,041,378,120	1,193,399,282

**Relative Importance of the Several Branches of Production.**—Due partly to adverse weather conditions and a succession of subnormal crops in recent years, the relative importance of manufacturing has been accentuated. Agricultural production in 1937 represented only about 23 p.c. of the net output of all industries, while the manufacturing group accounted for over half of the total net production. Eliminating the duplicated items, which are also included in the several extractive industries with which they are associated, we find that the output of manufacturing industries, not elsewhere stated, was 40·2 p.c. of the net total. Mining held third place in 1937, contributing nearly 12·6 p.c. of the Dominion total. Forestry was responsible for 9·6 p.c. of the net, while construction and electric power contributed 5·9 and 4·8 p.c., respectively. Custom and repair, fisheries, and trapping followed in the order given.

## Section 2.—Provincial Distribution of Production.

Seven of the nine provinces registered gains in net production in 1937 over the preceding year. Despite a decline in Prince Edward Island, the total for the Maritimes was up nearly 11 p.c. Extending the gain of the preceding three years, the net production of Quebec showed an increase of 17 p.c. and the advance of 14 p.c. in Ontario was substantial. The trend in the Prairie Provinces was uneven: Manitoba registered a big advance of about 42 p.c., but the net value of Saskatchewan's output was over 50 p.c. lower in 1937; Alberta increased the net value of its production by 27 p.c. The net result for the Prairie Provinces during 1937 was an increase of 3.7 p.c. Featured by substantial net gains in forestry, mining, and manufacturing, the recovery movement was extended in the British Columbia-Yukon region, the net value of the output rising by nearly 17 p.c.

**Relative Production by Provinces, 1937.**—In the following table the net commodity production is appraised on a per capita basis by provinces. This represents the net value of new wealth produced by capital and labour, and, as such, measures the annual dollar return on the natural resources and on the plant and equipment of the nation. It is distinct from, and must not be confused with, the national income, which includes, in addition to the net commodity production, the value of services, and the utilities of time, place, and possession that have a distinct though somewhat intangible value in the economic sense in the same manner as commodities produced.

Seven of the nine provinces recorded appreciable per capita betterment in 1937 over 1936. The lower agricultural production in Saskatchewan accounted for all the decrease in that province.

### 3.—Gross and Net Values of Production in Canada, by Provinces, 1936 and 1937.

Province.	1936. <sup>1</sup>				1937.

<sup>1</sup> Revised since the publication of the 1939 Year Book.

<sup>2</sup> Based on estimates of population given

on page 103.

<sup>3</sup> The value of production in Yukon, mainly in mining and trapping (including similar industries of the N.W.T.) was \$5,444,626 gross and \$4,147,174 net in 1937 and \$4,024,720 gross and \$3,387,894 net in 1936.

### Section 3.—Leading Branches of Production in Each Province, 1937 Compared with 1936.

**Maritime Provinces.**—Measured by an increase of nearly 11 p.c. in the net value of production, the Maritimes had a more prosperous year in 1937 than in 1936. While the return from agriculture was considerably reduced, the decline was more than counterbalanced by advances in forestry, mining, construction, and manufactures. The net receipts from the fisheries showed little change in 1937 compared with the preceding year.

**Quebec.**—Manufacturing was again the principal industry in Quebec, contributing, without duplication, over 47 p.c. of the net value of provincial production. In comparison, agriculture was only 14.5 p.c. and forestry 13.7 p.c. of the total net. Mining registered an encouraging gain, increasing from 6.9 to 8.0 p.c., while construction advanced from 5.4 to 6.8 p.c. of the provincial total.

**Ontario.**—The net value of manufacturing held the leading position in this Province in 1937, constituting more than half of the provincial total. Agriculture accounted for only 17.5 p.c., while mining advanced from 13.1 in 1936 to 14.4 p.c., visualizing the day when the mines of the Province may produce more new net wealth than the farms.

**Prairie Provinces.**—Agriculture naturally predominated in the Prairie Provinces, contributing about 60 p.c. of the net production in 1937. Despite serious drought in Saskatchewan, the agricultural total for the area declined only 1 p.c. from 1936, owing to gains in Manitoba and Alberta. Manufacturing accounted for over one-fifth of the regional output—a remarkable development of the last quarter century in a region that is considered predominantly agricultural. Mining continued to advance, supplying over 9 p.c. of the net total.

**British Columbia and Yukon.**—The net output from forestry in British Columbia during 1937 was \$64,488,000 or over one-quarter of the provincial production. Mining contributed the second highest proportion, viz., 21 p.c., while manufactures, eliminating duplication, comprised about 20 p.c. of the net. Agriculture was responsible for nearly 13 p.c. and fisheries accounted for only 5 p.c.

Tables 4 and 4A give the details of gross and net production by industries for each province in the years 1936 and 1937. In Manitoba, Saskatchewan, Alberta, and Prince Edward Island agriculture ranks in first place in net production, manufactures surpassing this primary industry in the other five provinces. Tables 5 and 5A present some very interesting comparisons. In Nova Scotia, indeed, during 1937 mining was more productive in net value than agriculture, while in New Brunswick forestry ranked above agriculture in the addition of new wealth. In British Columbia-Yukon, the products of forestry, of mining, and of manufacturing, ranked above agriculture.

On a provincial percentage basis, mining is very much more important in Nova Scotia than it is in the premier mining province of Ontario. Likewise, the generation of electric power is relatively a more important industry in Nova Scotia, New Brunswick, Quebec, Manitoba, Saskatchewan, and in British Columbia than it is in Ontario. Manufacturing is of first importance in Ontario and Quebec, and also in Nova Scotia.

**4.—Gross and Net Values of Production, Classified for Each Province, by Industries, 1936.**

NOTE.—Gross and net figures for 1936 have been revised since the publication of the 1939 Year Book. For Dominion totals, see Tables 1 and 2.

Agriculture, including stock raising and horticulture, is the most important single industry of the Canadian people, employing, in 1931, 28.7 p.c. of the total gainfully occupied population and 33.9 p.c. or over one-third of the gainfully occupied males. In addition, it provides the raw material for many Canadian manufactures, and its products in raw or manufactured form constitute a very large percentage of Canadian exports. For a statement of the occupied and the available agricultural lands in Canada, see p. 18 of this volume.

An introductory outline of the historical background of Canadian agriculture is given at pp. 187-190 of the 1939 Year Book. As now presented this chapter treats of current governmental activities—Dominion, in as much detail as space will permit (to utilize such space to the best advantage, the system of special articles not repeated from year to year has been adopted) and Provincial, by outlines and references to provincial sources of information. Comprehensive statistics of agriculture, collected and compiled by the Agricultural Branch of the Dominion Bureau of Statistics and covering Canada as a whole, close the chapter. These include data on values of agricultural production and farm capital, field crops, farm live stock and poultry, dairying, fruit, special crops, prices, miscellaneous, and, since Canadian exports of agricultural commodities are sold in the world market, a review of world statistics of agriculture, compiled from the publications of the International Institute of Agriculture.

### Section 1.—Government in Relation to Agriculture.

It is provided in Sect. 95 of the British North America Act that "in each province the Legislature may make laws in relation to agriculture in the province"; it is also "declared that the Parliament of Canada may from time to time make laws in relation to agriculture in all or any of the provinces; and any law of the Legislature of a province relative to agriculture . . . shall have effect in and for the province as long and as far only as it is not repugnant to any Act of the Parliament of Canada".

As a result of this provision, there exist at the present time Departments of Agriculture, with Ministers of Agriculture at their heads, both in the Dominion and in each of the nine provinces, though in two provinces the portfolio of agriculture is combined with one or more other portfolios in the hands of a single Minister.

### Subsection 1.—The Dominion Government.

A short sketch of the functions of the Dominion Department of Agriculture is published at pp. 212-223 of the 1936 Year Book, and an outline of agricultural progress in Canada and the Dominion Experimental Farms System appears at pp. 221-228 of the 1937 Year Book. In the 1938 Year Book a special article on the Prairie Farm Rehabilitation Program of the Dominion Government appears at pp. 223-230 and in the 1939 Year Book an article on the historical background of Canadian agriculture appears at pp. 187-190. The problems of the Entomological Branch of the Dominion Department of Agriculture, in controlling noxious forest insects are reviewed in a special article that appears in the chapter on Forestry at pp. 254-263 of the 1939 Year Book, since it is closely related to the subject of forest resources.

### AGRICULTURAL MARKETING LEGISLATION, 1939.

The Dominion Government enacted special legislation in the 1939 session of Parliament to deal with the marketing of agricultural products. The keynote of the new legislation is co-operative endeavour as exemplified in the Agricultural Products Co-operative Marketing Act and the Wheat Co-operative Marketing Act. In addition to these two Acts, Parliament passed the Prairie Farm Assistance Act, the Cheese Factory Improvement Act, and the Live Stock and Live Stock Products Act.

With the exception of the Live Stock Act, which deals mainly with the inspection and operation of stockyards and the transportation and inspection of live stock, live-stock products, and poultry (see under Dominion Legislation, 1939, in Index), the above legislation is discussed in detail below.

#### The Agricultural Products Co-operative Marketing Act, 1939

The main purpose of the Agricultural Products Co-operative Marketing Act is to make it possible for an organization of producers or processors to finance its producers through the marketing period. To this end a co-operative association may enter into an agreement with the Dominion Government to make an initial payment, through a selling agency set up under the Act, to primary producers; the Government guarantees that, if the average sale price of the agricultural product marketed falls below the initial payment, the Government assumes responsibility for such loss. The Act covers all farm products except wheat, which is dealt with under the Wheat Co-operative Marketing Act.

Co-operative associations already in operation and newly organized co-operatives may come under the provisions of the Act, if they make an agreement with the Minister of Agriculture to pursue the "co-operative plan" as outlined in the Act.

The co-operative plan is defined in the Act as an agreement or arrangement for the marketing of agricultural products that provides for three things: (1) Equal returns to primary producers for agricultural products of like grade and quality; (2) the return to primary producers of the proceeds of the sale of all agricultural products, delivered thereunder, produced during the period agreed upon, after deducting processing, carrying, and selling charges; (3) an initial payment to primary producers of a percentage not exceeding 80 p.c. of the average wholesale price of an agricultural product over the period of three years immediately preceding the year of production.

The various factors with respect to initial payment, allowance for costs of processing and selling, and differentials in price for the various grades for the particular agricultural product, are set out in the agreements with the various organizations that operate under the Act.

Agreements under this Act have been concluded with co-operative associations and processors marketing honey, alfalfa seed, onions, timothy seed, silver fox and mink pelts, and registered seed.

### **The Wheat Co-operative Marketing Act, 1939**

The Wheat Co-operative Marketing Act, which is applicable only to spring wheat grown in the Prairie Provinces and British Columbia, is similar in principle to the Agricultural Products Marketing Act. A co-operative association that wishes to avail itself of the provisions of the Act must enter into an agreement with the Dominion Government to make an initial payment to primary producers of an amount to be fixed by agreement for each grade of wheat but not exceeding 60 cents per bushel for No. 1 Northern, basis Fort William. If the price received for such wheat falls below the initial payment, the Government will pay the selling agency of the co-operative association or the elevator company the difference between the average selling price and the initial payment plus transport, operating, and carrying costs. A number of agreements have been made under the Wheat Co-operative Act, 1939.

Associated with the Wheat Co-operative Marketing Act is the Canadian Wheat Board Act, 1935, and Amendment Act, 1939, which are under the jurisdiction of the Minister of Trade and Commerce. Under these Acts the producer of wheat is guaranteed an advance of a fixed price per bushel, according to grade or place of delivery—70 cents per bushel in the case of No. 1 Northern, basis in store Fort William. This guarantee is applicable to 5,000 bushels only from any one producer in any one year. Quantities over 5,000 bushels must be marketed either through the open market or through a co-operative.

The wheat farmer, therefore, has three methods at his disposal to market his crop, viz., the Wheat Board, the open market, or co-operatively through pooling organizations.

### **The Prairie Farm Assistance Act, 1939**

The Prairie Farm Assistance Act is intended to aid farmers in years of distress by providing a measure of insurance to those who suffer low yields. There are two provisions in the Act, one dealing with a crop failure and one dealing with "emergency conditions". An emergency year is any crop year in which low prices (less than 80 cents per bushel for No. 1 Northern), low yields, and general conditions over which the individual has no control combine to make the position of the prairie farmer difficult beyond the financial care of the individual municipality or province. The Act declares the crop year 1939-40 an emergency year.

A crop failure may be declared in any one of the Prairie Provinces in any year when the Minister of Agriculture is assured that the average yield of wheat, from any cause other than hail damage, is 5 bushels or less per acre in each of 135 townships or more in Saskatchewan and in each of 100 townships or more in either Alberta or Manitoba.

Awards paid to farmers under this Act will be exempt from the operation of any law relating to bankruptcy or insolvency, or to garnishment or attachment, and

shall not be assignable either at law or in equity. This means that the farmer operating the farm will receive the payment in cash, and that he will have it for his own use to purchase the necessities of life for himself and his family.

Certain types of farm are exempt from the operations of the Act, namely: experimental farms, market gardens, ranches, Indian reservation farms, farm lands operated by a farmer who also operates more than 300 acres of cultivated land in townships not eligible for awards under the Act, farm lands declared submarginal and ordered evacuated under the provisions of a provincial statute, and irrigated lands on which the yield per acre is more than 12 bushels of wheat or the equivalent, in value, of other crops.

**Basis of Payments.**—*Emergency Year Assistance.*—In any crop year that has been declared an emergency year, there will be paid to each farmer living in a township where the average yield is 4 bushels or less per acre the sum of \$2 per acre on half his cultivated acreage. The maximum number of acres on which a farmer can receive payment is 200, so that the total payment to a farmer cannot exceed \$400. The 1939-40 payment will be made regardless of the price of wheat.

If the average yield is over 4 bushels and not more than 8 bushels an acre in a township, each farmer residing therein will receive \$1·50 per acre on half his cultivated acreage up to 200 acres, with a maximum payment of \$300. The farmer with 100 acres cultivated would receive \$75. The 1939-40 payment will be made regardless of the price of wheat.

If the average yield is over 8 bushels and not more than 12 bushels an acre in a township, each eligible farmer residing in such township shall receive one dollar per acre on half his cultivated acreage, but he cannot be paid on more than 200 acres so that the maximum amount a farmer may receive who lives in a township with a 9- to 12-bushel yield is \$200. A farmer will receive this amount in this class of township only if the average price is 70 cents or less per bushel for No. 1 Northern cash wheat. For each cent the average price is above 70 cents, 10 cents per acre will be deducted from the acreage payment so that at 80 cents the award will disappear. For instance, if the average price is 75 cents a farmer with 400 acres cultivated would receive 50 cents per acre on half of 400, which is 200 acres, a total of \$100.

*Crop Failure Assistance.*—When a crop failure area in any province has been declared by the Governor in Council, each farmer residing in such area shall receive a payment of \$2·50 per acre on one-half of his cultivated acreage. The maximum number of acres on which he can receive payment, however, is 200 acres so that the maximum amount of crop failure assistance a farmer may receive is \$500; the minimum a farmer may receive is \$200 regardless of the size of his farm. Payments will be made under the crop failure assistance section of the Act regardless of the price of wheat.

**The Prairie Farm Emergency Fund.**—Most of the money to cover crop failure assistance and emergency assistance for the first few years will necessarily come from the Dominion Treasury, although a levy of 1 p.c. on all grain marketed from farms in Western Canada is provided for in the Act. The levy will be turned over to the Board of Grain Commissioners and deposited by them in a fund known as the Prairie Farm Emergency Fund. When this fund is insufficient to pay awards under the Act, the deficiency will be paid out of the Consolidated Revenue Fund. Such an advance will be repayable without interest to the amount that the levy

provides. The 1 p.c. levy over the past few years would have yielded only about \$1,500,000 a year, which amount would have been quite insufficient to meet crop failure assistance in the past few years had this Act been in effect. It is hoped, however, that in years to come yields and prices will be better and a fund can be gradually built up so that a considerable amount will be available for agricultural assistance before recourse to public funds is necessary.

**Regulations Under the Act.**—The first step in obtaining awards under the emergency provision or the crop failure section of the Act or both, is the requirement that a province within the spring-wheat area make application to the Minister of Agriculture before August 15 in any year. Such application shall be supported by a list of townships considered to be eligible under the Act, with all available information pertinent to such application. The officer in charge of the administration of the Act, the superintendent, will then verify by inspection the eligibility for awards of townships included in such list. Each year, when the information on township yields and other information is complete, a Committee of Review shall be established, whose duties shall be to examine all the assembled data and determine the yield category into which townships shall be placed. It also shall rule upon the application of the Act and the regulations with respect to any classes of farmers whose eligibility for award may be open to question. The Committee shall report its findings to the Minister of Agriculture.

Before a farmer can benefit under the Act, he must fill out a prescribed form indicating the total number of acres of cultivated land in his farm. In the year 1939 such forms were required to be returned to the superintendent before August 1, but for subsequent years July 1 is the closing date.

**Operations Under the Act.**—The Committee of Review composed of three members was appointed by the Dominion Government on Nov. 25, 1939. The Governor in Council on the recommendation of this Committee declared, on Nov. 28, 1939, a crop failure area to exist in the Province of Saskatchewan. At the time of writing, the deliberations of this Committee are not completed but it is expected that a substantial number of townships in the three Prairie Provinces will benefit under the "emergency year" provisions of the Act. A farmer eligible for acreage payments receives 60 p.c. of the amount in the month of December and the remainder in the following March.

### **The Cheese and Cheese Factory Improvement Act, 1939**

The Cheese and Cheese Factory Improvement Act is intended to promote the production of high-quality cheese so that Canada may hold her preferred place for this product on the British market. The Act provides for the payment of a premium on high-quality cheese and also provides for assistance up to 50 p.c. of the amount expended towards the following: improvement of refrigerating and insulating cheese-ripening rooms in factories, standardizing of cheese-pressing equipment, and amalgamation of two or more factories into one factory.

The premiums paid by the Government amount to two cents per pound for cheese grading 94 score, and one cent per pound for cheese grading 93 score. The Government also pays one-half the cost of new material, new equipment, and labour utilized in reconstructing an existing factory or in building and equipping a new factory. The money will be paid provided that such newly constructed factory

replaces two or more existing factories. One-half the cost is being paid by the Government in the construction of up-to-date cheese-ripening rooms and also cheese-pressing equipment of a standardized size.

### THE CANADIAN FARM LOAN BOARD.\*

This Board was appointed by the Governor in Council under the provisions of the Canadian Farm Loan Act (c. 66, R.S.C. 1927, as amended by c. 46, Statutes of 1934 and c. 16, Statutes of 1935) and, as an agency of the Crown in the right of the Dominion, administers a system of long-term mortgage credit for farmers throughout Canada.

The Board is empowered to loan money to farmers for the payment of debts, for the purchase of farm equipment and live stock, to assist in the purchase of farm lands, for farm improvements or for any other purpose considered as improving the value of the land for agricultural purposes.

Loans may be granted on the security of first mortgages on farm lands actually operated by the borrower up to an amount not exceeding 50 p.c. of the appraised value of such farm lands, but, in any event, not in excess of \$5,000 and such loans are repayable on an amortized plan of repayment over a period not exceeding 25 years.

In virtue of amendments to the Act, enacted in 1935, the Board is also empowered to make additional advances to farmers, who, having obtained a first-mortgage loan from the Board, require additional funds, the amount of such additional advance not to exceed 50 p.c. of the amount of the first-mortgage loan, nor the aggregate of first- and second-mortgage loans to exceed two-thirds of the appraised value of the farm lands mortgaged as security for the loan, nor in any event an aggregate amount of \$6,000.

The capital requirements of the Board are provided as follows:—

- (1) Initial capital advance from the Government in the amount of \$5,050,000.
- (2) Sale to the Government of the capital stock of the Board equal to 5 p.c. of the loans made by the Board.
- (3) Sale of bonds secured by farm mortgages. At the present time these bonds are being sold to the Government on a  $3\frac{1}{2}$  p.c. interest basis with a term of 25 years. Provision is made for the guarantee by the Government of the principal of and the interest on the bonds of the Board.

The rate of interest charged by the Board on its loans is determined by the rate of interest yielded by the latest series of such bonds increased by an allowance sufficient, in the judgment of the Board, to provide for expenses of operation and reserves for losses. The current rate of interest on loans made by the Board is 5 p.c. on first-mortgage loans and 6 p.c. on second-mortgage loans.

The first appointments to the Board were made in 1929 and loaning operations were then initiated in the Provinces of British Columbia, Alberta, Manitoba, Quebec, New Brunswick, and Nova Scotia. Following the amendments passed in 1935, loaning operations were initiated in that year in the Provinces of Saskatchewan, Ontario, and Prince Edward Island. Loaning operations are now being carried on by the Board in all provinces of Canada. The head office of the Board is at Ottawa and a branch office has been established in each province.

\* Revised by A. H. Brown, Secretary, Canadian Farm Loan Board, Ottawa.

### THE DOMINION MARKETING BOARD.

The Dominion Marketing Board was established under authority of c. 57 of the Statutes of 1934—The Natural Products Marketing Act, 1934. The chief powers of the Board, as stated in Sect. 4 of the Act, were: to regulate marketing and distribution of natural products of agriculture, the forests, sea, lake, or river, as may be designated

by the Governor in Council; to conduct pools for the equalization of returns received from their sale and compensate any person for loss sustained in withholding such products from the market or for shipment to any country whose currency is depreciated in relation to Canadian currency; to assist the construction of marketing facilities by grant or loan. Following the change in Government after the elections of 1935, the Administration filed a general reference of the social legislation passed by the former Administration to the Supreme Court and to the Privy Council. The Privy Council decision was made on Jan. 28, 1937. In both cases the legislation was declared *ultra vires* of the Dominion Government. All Orders in Council relating to the Marketing Board were subsequently revoked and the Dominion Marketing Board itself has not functioned since 1936. Prior to the reference being made, 22 cases were acted on by the Board.

### Subsection 2.—Provincial Departments of Agriculture.\*

**Prince Edward Island.**—The Department of Agriculture is presided over by a Minister, and the staff consists of a Deputy Minister and live-stock superintendent, a superintendent of women's institutes, a dairy superintendent, three field promoters and a field man for the fox industry. Assistance is given in co-operative marketing, promotion of the live-stock industry, encouragement exhibitions, the formation of boys' and girls' clubs, and the welfare of agriculture generally.

**Nova Scotia.**—Agricultural policies in the Province of Nova Scotia are administered by the Department of Agriculture and Marketing, with the Minister's Office and those of the Director of Marketing, the Land Settlement Board, Statistician and Superintendent of Immigration, Publicity Representative, Forest Products Representative, and Provincial Exhibition Commission, situated in Halifax. Many of the technical officials are located at the Agricultural College and Farm, Truro, Divisions of the Department include: extension service, agricultural societies, associations, and exhibitions; dairying; poultry; live stock; entomology and botany; apiculture; animal pathology; agricultural engineering; and women's institutes.

**New Brunswick.**—The branches of the Department of Agriculture of New Brunswick are as follows: live-stock and agricultural societies; dairying; herd improvement; soils and crops; poultry; horticulture; women's institutes; extension; industry, immigration, and farm settlement; field husbandry; beekeeping; fur; credit unions and co-operatives.

**Quebec.**—The administration of agricultural policies is entrusted to services and sections as follows: extension work, dealing with all problems faced by the agricultural county agents (ninety-eight in number); rural economy; animal husbandry; health of animals; plant protection; agricultural education; domestic science; field husbandry; publicity; and administration. The Chief Technical Adviser is directly responsible to the Deputy Minister, who remains the main technical authority of the Department. Each service is divided into divisions dealing with minor problems. There are also many other activities such as the Quebec Farm Credit Bureau, agricultural merit competition, provincial dairy school, provincial handicraft school,

\* For publications of provincial Departments of Agriculture, see in the index the entry "Publications of Provincial Governments".

etc. There is, therefore, for any kind of agricultural activity, a corresponding administrative service, which is in a position to furnish accurate information to interested persons.

**Ontario.**—The Ontario Department of Agriculture includes the following branches: statistics and publications; agricultural and horticultural societies; live stock; women's institutes; dairy; fruit; agricultural representatives; crops, seeds, and weeds; co-operation and markets, including administration of the Act re credit unions; and the Milk Control Board. The Department is responsible for the administration of the Ontario Agricultural College, the Ontario Veterinary College, the Kemptville Agricultural School, the experimental farms at Guelph, Ridgetown, and Vineland, and demonstration farms at New Liskeard and Hearst.

**Manitoba.**—The Manitoba Department of Agriculture serves through the following branches: agricultural extension, dairy, publications, live stock, the Debt Adjustment Board, the Registrar of Co-operative Associations, and the Office for Animal Pathology.

The Agricultural Extension Branch aids field-crop production, horticulture, beekeeping, poultry raising, suppression of insect outbreaks, boys' and girls' club work, and various home-making projects. It also directs the activities of rural agricultural representatives and supervises the work of agricultural societies, horticultural societies, and women's organizations. The Dairy Branch grades all cream supplied to creameries, supervises the activities of creameries and cheese factories, and gives general support to the dairy industry. The Live Stock Branch licenses stallions and conducts projects and administers policies through which encouragement is given to the production of better types of animals. The Publications Branch publishes and distributes agricultural literature and also is in charge of agricultural statistics. The Debt Adjustment Board, operating by authority of provincial legislation, seeks to avoid needless insolvency among farmers. The functions of the other offices are indicated by their titles.

**Saskatchewan.**—The Department of Agriculture includes branches with duties as follows: The Live Stock Branch examines and licenses stallions, safeguards the health of live stock, facilitates purchase and sale of cattle, sheep, and hogs to farmers in the purebred sire areas, arranges for exhibits of live stock, and registers brands; maintains flock-culling and turkey-grading services and administers an approved hatchery policy. The Field Crops Branch promotes good cropping and tillage practices, encourages the use of good quality seed and distributes such under a seed exchange policy, and provides measures for suppressing insect and weed pests. The Dairy Branch licenses creamery operators, cream graders and testers, bonds creameries, and promotes herd improvement through cow testing. The Statistics Branch, in co-operation with the Dominion Bureau of Statistics, maintains a crop-reporting service and gathers data respecting crops and live stock. The Co-operation and Markets Branch administers legislation governing co-operative organizations including credit unions, promotes co-operative activities, provides an economic research and inspection service, and publishes bulletins, reports, and a news letter. Under the Agricultural Representative Service the Province is divided into districts where qualified men carry on promotional and educational work. The Apiary Division registers beekeepers and promotes better management practices. Grants to agricultural societies are paid through the Department but activities are directed

by the College of Agriculture. The Land Utilization Board, composed of representatives of several interested departments of government, endeavours to bring about the withdrawal from arable farming of lands unsuitable for such use.

**Alberta.**—The Alberta Department of Agriculture serves the agricultural industry through its many branches, each of which is concerned with the problems specifically related to the various types of farming and agriculture conducted within the Province. Through the Extension Branch and eighteen District Agriculturists a comprehensive educational program is carried on, the aim of which is the improvement of agriculture and the enrichment of rural life through meetings, field days, short courses, fairs, and personal contacts. The Department endeavours to improve all phases of the industry. A special section of the extension program is devoted to women's work, through demonstrations, lectures, and correspondence courses. The young people of rural communities receive attention through school fairs, boys' and girls' camps, junior clubs, and two schools of agriculture, while during the past two years, the Department has co-operated with the Dominion Government in the Dominion-Provincial Youth Training program. The Provincial Horticultural Station at Brooks is serving a very useful purpose through its program of testing and propagating hardy varieties of fruit and ornamental trees.

The live-stock improvement program represented by the Bull Exchange Policy, the Boar Exchange Policy, the Sow Distribution Policy, the Stallion Club Policy, and the Feeder Associations Act, is of special importance. These policies have been supplemented through the establishment of new and larger herds of live stock at the provincial demonstration farms at Olds, Vermilion, and Brooks.

The production of high-quality field crops is encouraged and all branches are striving for improvement in the quality of agricultural products.

Agricultural information is distributed by the Extension Branch through bulletins and other means, and crop reports and statistical data are prepared and released from time to time. Encouragement is given for the formation of local groups or organizations of farmers, which have as their objective the improvement of agriculture in the community.

**British Columbia.**—The Department of Agriculture consists of three main divisions:—

1. The Administration Division is responsible for the general direction of agricultural policies; administration of legislative measures affecting agriculture; supervision of agricultural extension programs; collection of agricultural statistics; preparation of displays for provincial, national, and international exhibitions and assistance to fall fairs. It distributes departmental publications; supervises junior club projects; farmers' and women's institutes, and the Markets Branch.

2. The Animal Industry Division has supervision over live-stock work including promotion and improvement; brand inspection; and control of contagious diseases of animals. This Division consists of live-stock, veterinary, dairy, and poultry branches.

3. The Plant Industry Division includes horticulture, plant pathology, entomology, and field-crop branches; the general direction of fruit and vegetable production and surveys dealing with orchards, small fruits and bulb acreages, as well as greenhouse areas; the suppression of insect pests and plant diseases; inspection

and control of noxious weeds. Extension officials promote either animal industry or plant industry, depending upon the predominating type of farming carried on in the several districts.

### Subsection 3.—Provincial Agricultural Colleges and Schools.

#### AGRICULTURAL COLLEGES.

##### Nova Scotia

*College of Agriculture, Truro.*—The Nova Scotia Agricultural College is equipped to give instruction in all branches of agricultural education. Three types of course are given:—

1. The “general course” is a complete two-year course designed for young men who intend to make practical farming their life work. The associate diploma is awarded to successful candidates.

2. The “degree course” (the first and second years of the four-year degree course) qualifies students for the associate diploma and for admission to the third year at either the Ontario Agricultural College, Guelph, Ont., or Macdonald College, Ste. Anne de Bellevue, Que.

3. Vocational short courses for both men and women are conducted under the Youth Training Program, with twelve to fifteen courses—in as many subjects or projects—each college year, ranging from one week to one month in length.

A live-stock farm of about 300 acres, carrying several popular breeds of cattle, horses, sheep, and swine for teaching and demonstration purposes, and growing several varieties of roots, corn, and cereal crops, for the same reason, is operated in connection with the College. The horticultural department operates a limited area devoted to vegetable and fruit crops, while the poultry department carries three breeds of poultry for educational purposes.

Various divisional officers of the Department of Agriculture, with offices at Truro, are professors heading the respective departments at the College, and also assist in lecture and demonstration work at rural short courses and farmers’ meetings.

The Extension Division of the Department of Agriculture directs extension work through agricultural representatives in the respective counties throughout the Province. Boys’ and girls’ club work is a major activity. Many short courses are conducted throughout the year. A farm-planning project is expanding rapidly. The Director of this Division is Professor of Economics, while the Assistant Director is Instructor in Farm Management.

Promoting the use and encouraging the distribution of ground limestone is directed by the Provincial Chemist and Professor of Chemistry whose other field activities include soil surveys and soil-testing work in all sections of the Province.

The Provincial Entomologist and Professor of Entomology carries on spraying tests, and promotes better spraying through spray circles and orchard-management projects in the fruit-growing section during the summer, as well as promoting insect-control measures in other sections.

The Provincial Botanist and Professor of Botany co-operates in spraying and entomological activities, in addition to the botany and plant disease work.

The Provincial Agronomist and Professor of Agronomy promotes the use of better seed, assists with crop competitions, pasture improvement work, ploughing matches, etc.

Drainage surveys, ditching (with power ditching machines), laying tile drains, machinery demonstrations, use of explosives in ditching, clearing land, etc., are carried on by the Head of the Agricultural Engineering Division and Professor of Agricultural Engineering.

Orchard surveys, short courses in pruning and grafting, encouragment of cranberry growing and all fruit and vegetable work come under the direction of the Provincial Horticulturist and Professor of Horticulture.

Fur farming extension work, control of animal diseases, and operation of a blood-testing laboratory for poultry are projects carried on by the Provincial Animal Pathologist and Professor of Veterinary Science.

Beekeeping is promoted throughout the Province by the Provincial Apiarist and Instructor in Apiculture.

Agricultural Associations, general animal work, dairy herd improvement, and stallion inspection are supervised by the Provincial Animal Husbandman and Associate Professor of Animal Husbandry.

The office of Superintendent of Exhibitions for the Department is also located at the College.

The Provincial Dairy Superintendent and Professor of Dairy Industry supervises creameries, assists in butter marketing, and serves as secretary of the Dairy-men's Association of Nova Scotia, the Ice Cream Manufacturers' Association, and of the Dairy Arbitration Commission.

The office of the Provincial Poultryman and Instructor in Poultry Husbandry serves the industry as required.

The Director of Women's Institutes and Instructor in Home Economics and her assistants carry on a great deal of field work, including numerous short courses in home crafts throughout the Province during the spring, summer, and fall, as well as two special courses at the College during the winter months.

## Quebec

*Macdonald College, St. Anne de Bellevue.*—Macdonald College is an incorporated College of McGill University and is situated twenty miles west of Montreal. It comprises: the Faculty of Agriculture; the School of Household Science; and the School for Teachers. Courses in agriculture include a four-year course leading to the B.Sc. (Agr.) degree and a two-year practical course for farmers' sons leading to a diploma. Postgraduate work leading to the degrees of M.Sc. and Ph.D. is available under the Faculty of Graduate Studies and Research of McGill University. The School of Household Science offers a four-year course leading to the B.H.S. degree and a one-year "Homemaker" course. The School for Teachers trains teachers for the Protestant schools of the Province of Quebec and grants elementary, intermediate, and kindergarten director diplomas. The Institute of Parasitology, operated by McGill University and the National Research Council, is situated on the College campus. Glenaladale, the staff community house, serves as an auxiliary laboratory for the students in the Household Science classes.

The College carries on extensive research both alone and in co-operation with the Provincial and Dominion Governments. Particular attention is paid to the creation and propagation of new and improved varieties of farm crops; to problems of plant and animal nutrition; to improvement of the pasture lands of the Province; to fertilizer and tillage experiments; and to the study of animal and plant pests.

Information obtained as a result of the experimental work is available in the form of free publications to anyone interested. The laboratories of the various departments of the College examine and report on specimens sent in by growers, and the field plots, orchards, stables, and barns are open to visitors at all times. One department is a distribution centre for plans and blueprints for farm buildings and gives assistance with various farm construction and engineering problems, including the planning of drainage systems. Members of the staff assist with regional short courses throughout the Province and act as judges at agricultural and domestic science exhibits at fairs, etc.

The teaching and experimental staff number about 70 members, and the total enrolment for the session 1938-39 was 918.

*Institut Agricole d'Oka.*—The Institute, located at La Trappe, Que., was founded in 1893. In 1908 it was affiliated to Laval University and is now affiliated with the University of Montreal.

The farm covers 1,800 acres and the diversity of soils makes possible the carrying out of extended experiments. The orchards cover about 67 acres, with nearly 4,000 fruit trees, and particular attention is directed to fruit culture, apple growing being a specialty. Live stock raised includes Belgian horses, Ayrshire and Holstein cattle, sheep, and hogs. Some 2,000 hens are kept, the Chantecler breed having been originated at the Institute.

In addition to the regular four-year course in agronomics, a two-year course is provided for farmers' sons, and short winter courses are offered to farmers at the request of the Provincial Department of Agriculture. During the past ten years, special emphasis has been placed upon short courses designed for farmers' sons. In the winter of 1929-30, home courses were started at Oka; designed for 4,000 students, they were so popular that the total attendance reached 15,000. Annual summer courses for rural school inspectors are conducted, and about 100 inspectors attend. Similar short courses, open to farmers of particular districts, are also offered and have had great effect in focusing the attention of the rural population on the possibilities of life on the farm. Following one of these courses, no less than nine new societies of young farmers were established in the district of Shefford alone.

In addition to the province-wide activities of the Institute, special work has been done by the members of the staff in the Montreal district, such as research and farm contest work. Specialized work in the localities surrounding the Institute are the organization of a live-stock breeders' society in the County of Two Mountains, and an association of young breeders of baby chicks in the same county. The foundation of the Institut Rosell at Oka has done much to popularize 'yogurt' in Canada and has encouraged the making of pure starters for the production of this product at home.

For the past ten years the Institute has published literature on stock and poultry raising; botany; fruit, vegetable, and flower culture; and a four-volume course on general agriculture. The demand for these publications indicates that they are greatly appreciated by the farmers of the Province.

*Ecole Supérieure d'Agriculture de Sainte-Anne-de-la-Pocatière.*—This school, situated along the Lévis—Rivière-du-Loup line of the Canadian National Railway, has a student body of about 175 boarders. The school was established in 1859 by Abbé François Pilote. It now has a triple aim: agricultural research; agricultural instruction of all grades; and agricultural extension work by means of lectures, home courses, co-operation courses, exhibitions, etc.

Its regular curriculum includes a superior course in agriculture of four years duration, open to selected students in possession of the degree of Bachelor of Arts; an agronomic course of three years open to all Bachelors of Arts; two courses in practical agriculture for farmers' sons, one of which covers twelve months of study divided into two winter semesters and the other only one winter semester. The Ecole Supérieure is affiliated with Laval University of Quebec. The Faculty of Sciences confers on its graduates the degree of B.Ag.Sc. (Bachelor of Agricultural Sciences). The agronomic course is completed with the B.A. diploma (Bachelor in Agriculture). A certificate of agricultural ability is conferred on farmers' sons who complete the prescribed course.

The Ecole de Sainte-Anne operates a mixed culture farm covering 500 acres. Its herd of Ayrshire cows is of special value. The departments of poultry and fruit and garden horticulture are organized for the training of specialists in these lines.

### Ontario.

*Ontario Agricultural College and Experimental Farm, Guelph.*—On May 1, 1874, the Ontario Agricultural College and Experimental Farm was established near Guelph with 500 acres of land, an ordinary set of farm buildings, and a large two-story house. The first class consisted of 28 students.

At the present time, the College farm consists of 1,050 acres, a splendid layout of barns, implement sheds, and work shops. There are 26 large buildings which provide for classrooms, laboratories, offices, dormitories, dining halls, and recreation facilities.

Macdonald Institute, which offers courses in Home Economics, was donated by Sir William Macdonald in 1902. Trent Institute, known as the Canadian School of Baking, was built with funds donated by the Bread and Cake Bakers' Association of Canada in 1927.

In addition to the regular courses, many short courses lasting from ten days to three months are offered to various farm groups including school teachers of the public schools. Instructors are also furnished for a large number of short courses conducted in the Province under the leadership of the Agricultural Representatives Department.

Research and demonstration work form an important part of the program of the College. O.A.C. 21 barley, which is grown on nearly 75 p.c. of the barley land in Canada; Erban oats, a rust proof variety—high yielding and of good quality; soy beans O.A.C. 211; and many other varieties of high-quality grains are the product of the experimental fields of the Guelph farm.

The Experimental Union, an organization of farmers working with the College, have tested these better facilities throughout the farming districts. With these tests has been combined the use of commercial fertilizers and, in this way, farmers have been enabled to secure larger yields of better-quality crops.

Soil surveys of sixteen counties have been completed. This work will be continued until all counties of the Province have been mapped and studied. More than five thousand soil samples, received from farmers, are analysed each year and recommendations given for soil treatment and crop management.

From the herds and flocks, which are maintained at a high standard and which carry some of the best producing blood lines, the surplus breeding stock is sold to the farmers. In this way, a very direct and material improvement has been made in live-stock production.

Through the Departments of Animal Husbandry, Field Crops, Poultry, Agricultural Engineering, Animal Nutrition, Extension, Horticulture, Dairying, Apiculture, Chemistry, Botany, Entomology, Bacteriology, and Economics, an active relationship is maintained with the farmers and a valuable, helpful service is rendered to them on the many problems confronting agriculture.

### Manitoba.

*Faculty of Agriculture and Home Economics, University of Manitoba, Winnipeg.*—Members of the Faculty of Agriculture and Home Economics attempt to promote the interests of agriculture in Manitoba through correspondence with farmers, through demonstrations to visiting farmer groups, through press articles and bulletins, and through instruction to long-course students in the degree and University School of Agriculture classes as well as to students who attend the various short courses offered from time to time during the year.

During the year 1938-39 approximately 15,000 letters and telephone calls were answered by the agricultural members of the Faculty. These inquiries had to do with an extremely varied set of topics, relating to the selection and management of field crops, weed control, the selection and feeding of farm animals including poultry, insect control on field crops, garden crops, trees and farm animals, milk and its products, types of soils and their management, diseases of farm animals, farm buildings, fur farming, etc.

During the year many groups of farmers as well as individual farmers visited the University. Among the organized groups that visited the agricultural departments in 1938-39 were the Junior Seed Growers, Boys' and Girls' Clubs, Women's Institutes, Dairy Cattle Breeders, Poultry Breeders, Seed Growers, Farmers' Groups, Vegetable Growers, Youth Training Groups, Manitoba Agronomists, and Manitoba Loan Inspectors' Association and Appraisal Institute of Canada.

Agricultural members of the Faculty prepared or took a part in preparing twenty-two articles and reports during the year 1938-39. Thirty-one radio talks were delivered during that period. Faculty members attended many agricultural meetings at country points during the year.

Farmers and others interested in special phases of agriculture have an opportunity of attending numerous short courses offered throughout each winter. Ten of these were offered during the 1938-39 session on poultry, beekeeping, dairying, farm equipment repairs, field crops, fur farming, horticulture, etc.

Researches are being carried out in Animal Science, Bacteriology and Animal Pathology, Dairying, Entomology, Plant Science, and Soils. A detailed survey has been made of approximately ten and one-half million acres located largely in the southern part of the Province.

The Faculty of Agriculture and Home Economics enrolled 412 men and women in the degree courses in Agriculture and Home Economics and 89 students in the University School of Agriculture and Homemakers' Course in the session 1938-39.

### Saskatchewan.

*College of Agriculture, University of Saskatchewan, Saskatoon.*—The College of Agriculture occupies a central place in the agricultural life of the Province. On the academic side it offers a four-year course leading to the degree of Bachelor of Science in Agriculture (B.S.A.) and a two-year course of five months each winter leading to a Diploma in the School of Agriculture. Through its investigations the

College aims to serve the farmers of the Province by studying their problems and by means of practical demonstrations to encourage the use of better farming methods. Much attention has been given in recent years to methods of controlling soil drifting, breeding of rust-resistant wheat, live-stock improvement and management, animal diseases, farm machinery, soil surveys, and farm management. Poultry, dairying, and horticulture also receive their due share of attention.

Contact with the farmers of the Province is maintained through various activities of the Extension Department in which all members of the College staff participate. Field demonstrations in the summer and short courses in the winter help to translate the results of investigations into farming practice. Organized activities of various kinds are arranged through officially constituted agricultural societies directed by the Head of the Extension Department. Homemakers' clubs, homecraft clubs, and boys' and girls' clubs provide valuable instruments for rural education. Finally the Dominion-Provincial Youth Training Program in rural areas may be mentioned; this is directed by the office of the Extension Department and consists of short courses of from two to four weeks duration held in community centres throughout the Province, and longer courses of six weeks to five months, held at the College.

The University is also the centre for many agricultural conventions and meetings throughout the year. Such occasions provide opportunities for lectures and demonstrations on matters of practical importance to farmers.

### Alberta.

*Faculty of Agriculture, University of Alberta, Edmonton.*—In the Faculty of Agriculture a four-year course, leading to the degree of B.Sc. in Agriculture, is offered, with some variation in entrance requirement. Up to the present junior matriculation has been the requirement for entrance but a move is under way to raise this to senior matriculation, with no change in the length of the course. About one-quarter of the students come from the Provincial Schools of Agriculture. These Schools offer a course that is vocational in its intent but some of the students at the Schools desire to go further. Up to this time they have been allowed entrance to the Faculty of Agriculture in its second year, thus reducing the course to three years in such cases. It is expected that, beginning with 1940-41, the entrance requirements will be established as junior matriculation standing and a diploma from a School of Agriculture; the course will then be made a four-year course for all.

Three activities of the Faculty of Agriculture are teaching, research, and extension. In the Faculty a very earnest effort is made to retain a program of research, carried on under the direction of the teaching staff. The advantage of this is twofold: the results of research in itself, and the effect upon the instruction given to students. The extension work carried on by the members of the Faculty covers three fields: Radio service, over the Faculty's own station, hooked up with other stations to form a widespread network; bulletin service—the bulletins are reports of work done rather than mere expressions of opinion; work done for the Provincial Department of Agriculture at fairs, short courses and other public functions, the expense carried by the Department of Agriculture—this has been found a very satisfactory arrangement in every way.

The live-stock farm is situated two miles from the University and students attend classes held there in the pavilion. The highlights of the Animal Husbandry Department may be mentioned as follows:—

- (1) Extensive feeding experiments with cattle, sheep, and swine;
- (2) Preparation and exhibition of market classes of animals;
- (3) Research work in co-operation with the Dominion Department of Agriculture and the National Research Council.

The activities of the Field Crops Department include plant breeding, bio-chemistry (milling and baking), and forage-crop work.

In addition to the University field experiments, substations are located in several parts of the Province.

The Soils Department is continuing the work of Soil Surveys in co-operation with the Dominion Department of Agriculture. Soil and fertilizer tests are carried out at the University and at several substations.

In dairying, agricultural engineering, entomology, horticulture, poultry, and veterinary science a certain amount of survey and experimental work is always considered advisable as a basis for teaching.

### **British Columbia.**

*Faculty of Agriculture, University of British Columbia, Vancouver.*—The Faculty of Agriculture is an integral part of the University of British Columbia. There are six Departments in the Faculty: Agronomy, Animal Husbandry, Dairying, Horticulture, Poultry Husbandry, and Agricultural Economics. Students may specialize in these Departments and, in addition, because of the close association with the other Faculties of the University, may do special work in plant pathology, plant nutrition, entomology, soil chemistry, and bacteriology and allied science subjects in relation to agriculture.

The extension activities of the Faculty are under the direction of the Head of the Department of University Extension. The activities consist mainly of single individual lectures, lecture series, night classes in horticulture and poultry husbandry, and short courses under the Dominion-Provincial Youth Training Plan.

The services to farmers include only those activities for which laboratory facilities are required, such as chemical and bacteriological examination of soil samples, examinations for mineral deficiencies in plants, diagnoses of poultry diseases, examinations of milk, butter, and cheese samples, poultry blood-testing for pullorum disease, and other related activities.

At the present time an important project in the field laboratory is the production of Elite seed of varieties of field crops that are grown in the Province. This is in co-operation with the Provincial Department of Agriculture. The project that has to do with the breeding and selection of an underground spreading type of alfalfa is reaching an interesting stage. A quantity of seed was produced this year. The project is in co-operation with the Dominion Department of Agriculture.

Research activities, other than those being carried on by students under direction, include: causes of raspberry failure, paralysis and coccidiosis in poultry, surface taint in butter, and the value and uses of fish oils. An additional research in soils and dairying comes under the general head of activators for enzymes. Progress has been made in the improvement of the Cambar breed of poultry brought from Cambridge University, England.

The members of the Faculty are on call in their offices for special consultations on agricultural problems, and also answer about five thousand letters per year from correspondents seeking information in relation to their immediate difficulties.

### AGRICULTURAL SCHOOLS.

In addition to agricultural colleges, three of the provinces conduct agricultural schools with two-year courses similar to the diploma courses in the colleges: Quebec at Rimouski and Ste. Martine; Ontario at Kemptville; Alberta at Olds and Vermilion. These are residential schools drawing their students from a wide area, and quite distinct from the locally supported agricultural high schools such as are operated at Woodstock, N.B., or Beamsville and Ridgetown in Ontario. In the ordinary high or post-elementary schools agriculture receives varying emphasis as between provinces but is taught to some extent in all.

## Section 2.—Statistics of Agriculture.\*

**Crop-Reporting Service.**—The voluntary crop-reporting service of the Dominion Government, which has been in operation since 1908, has for its object the issue of accurate, timely, and independent reports on crop conditions throughout the Dominion: first, in the interests of the general body of Canadian farmers; secondly, for the information and guidance of other interests allied to and dependent upon agriculture (interests represented by statesmen, economists, bankers, grain dealers, transportation agents, and others); and thirdly, for reporting to the International Institute of Agriculture at Rome (to which Canada is an adhering country) in return for reports on the production of other countries and of world totals that influence prices and consequently affect the interests of Canada. Supplementing the monthly reports from crop correspondents, the Bureau issues telegraphic crop reports utilizing the services of agriculturists throughout the Dominion. For the Prairie Provinces, these are issued every week from the latter part of May to the beginning of September while the reports on a Dominion-wide basis are issued every two weeks during the same period. The program of reports for 1940-41 is given in the "Monthly Bulletin of Agricultural Statistics", January, 1940, pp. 58-60, and is also issued as a special leaflet.

**Annual Statistics.**—In addition to the crop-reporting service, statistics of the areas under field crops and of the numbers of farm live stock are collected. This work has been conducted since 1918 by the Dominion Bureau of Statistics in co-operation with the Provincial Governments. The statistics are obtained from schedules that are at present returned by about one-fifth of the farmers of Canada. They form the basis of the estimates for the whole of Canada. The results for wheat, oats, barley, rye, and flaxseed in the three Prairie Provinces are ready for publication in late July, while the results for the remaining crops and for the numbers of farm live stock are published in October and November. The areas, thus determined, when multiplied by the average yields per acre as reported by crop correspondents, form the basis of the total estimated production for each crop.

\* Revised in the Agricultural Branch, Dominion Bureau of Statistics. This Branch is concerned with both primary and secondary statistics of agriculture, including statistics of the production and distribution of agricultural commodities. The primary statistics relate mainly to the reporting of crop conditions, crop and live-stock estimates, values of farm lands, wages of farm labour, and monthly and annual prices received by farmers for their products. The secondary statistics relate to the marketing of grain and live stock, dairying, milling, and sugar industries, and cold-storage holdings. A list of the publications of this Branch is given in Chapter XXIX, Sect. I, under "Production".

AGRICULTURAL PRODUCTION  
1918-1938

# AGRICULTURAL PRODUCTION 1918-1938

The June schedule covers the areas sown to field crops, the numbers of live stock and poultry on hand, and breeding and marketing intentions with regard to live stock and poultry. The December schedule contains practically the same items with the exception of field-crop areas.

The schedules are distributed and collected through the agency of the rural schools in New Brunswick, Quebec, Ontario, Manitoba, and Saskatchewan, while in Prince Edward Island, Nova Scotia, Alberta, and British Columbia the schedules are sent direct to the farmer through the mail.

**Monthly Bulletin of Agricultural Statistics.**—Originally established in 1908 as the "Census and Statistics Monthly", but changed to its present title in April, 1917, this publication is now in its thirty-third year. It is the official organ not only for the monthly crop reports and annual statistics previously described, but also for statistics of dairying, eggs, fruit, apiculture, hops, tobacco, maple products, sugar beets, beet sugar, flax fibre, clover and grass seeds, visible supplies, prices, values, foreign agriculture, and other subjects in considerable variety.

**Census Statistics.**—In addition to the statistics collected annually, which are the subject of this section, valuable information is published following each decennial census. The total number of farms, their tenure, acreage, value, mortgage debt, farm population, farm machinery and facilities, etc., are treated at pp. 295-301 of the 1934-35 Year Book. A summary presentation of agricultural development since 1871 is given in Subsection 9, pp. 270-273 of the 1936 Year Book.

### Subsection 1.—Value of Agricultural Production and of Farm Capital.

**Value of Agricultural Production.**—It is important to note that the figures of value of commodities produced on Canadian farms, shown in Table 3, represent gross values, as no distinction is made between crops used as materials for other kinds of production, such as the feeding of live stock, and no allowance is made for the costs of production. The total revenue for 1938 shows a decrease of \$19,275,000 or 1.9 p.c. as compared with 1937, which is accounted for largely by the decreased value of field crops.

### 3.—Estimated Gross Values of Agricultural Production in Canada, Itemized by Provinces, 1934-38.

NOTE.—Figures subject to revision. Preliminary figures for 1939 and revised figures for 1935-38 will be found in the "Monthly Bulletin of Agricultural Statistics", March, 1940.

**Value of Farm Capital.**—The items included in the term "farm capital" as used in Table 4 are: lands and buildings; implements and machinery, including motor trucks and automobiles; and live stock, including poultry and animals on fur farms. The 1931 values of lands, buildings, implements, and machinery were reported by decennial census taken at June 1, in that year. Changes in the total value of lands and buildings for the years 1932 to 1938 have been based on the value of occupied farm lands reported annually by crop correspondents, while those in the annual values of farm implements and machinery have been estimated on the basis of sales reported each year: in the case of the Prairie Provinces, data are based on the Quinquennial Census of 1936.

<sup>1</sup> Revised since the publication of the 1939 Year Book.

The preliminary estimate of the current value of farm capital in Canada for 1938 is \$4,654,580,000 as compared with the revised estimates of \$4,720,751,000 for 1937; \$4,626,161,000 for 1936; \$4,712,391,000 for 1935; \$4,464,147,000 for 1934; and \$4,443,159,000 for 1933.

**Average Values of Farm Lands.**—The average values per acre of farm lands are as estimated by crop correspondents and show the rise in land values between 1910 and 1920, the general decline with moderate fluctuations from 1920 to 1929, and the rapid fall since 1929 to a point below the 1910 level for the country as a whole.

## Subsection 2.—Acreages, Yields, and Values of Field Crops.

**Chief Field Crops of the Latest Ten Years.**—Rapid increases in the acreages of field crops was a characteristic of the period previous to and during the War of 1914-18, when settlement of the western plains occurred. During the latest ten years acreages have been relatively stable for wheat and oats. Fluctuations in the areas devoted to barley, rye, and flax have been quite marked as changes in the prices of these

crops encouraged or discouraged production. Hay and clover acreage has shown a tendency to decline, but an upward trend in alfalfa acreage has occurred, owing to the development of seed-producing areas in Western Canada. Successive droughts in the West considerably reduced production of the principal grain crops from 1933 to 1938, but in 1939 the average yield of wheat exceeded the long-time average. This average is designed to give the reader a better idea of the productivity of Canada's farms than would be obtained from an examination of the figures of the past few years, which naturally reflect the effect of drought conditions in Western Canada.

## 6.—Acreages, Production, and Values of Principal Crops Grown in Canada, 1930-39, with Long-Time Averages.

NOTE.—Comparative figures for the years 1908-28 are given in the Canada Year Book, 1929, pp. 230-232 and for 1929 in the Canada Year Book, 1939, pp. 203-204. The total value for wheat for 1912 should be \$139,090,000 instead of \$19,090,000. For certain figures for earlier years on acreage, production, and value see Statistical Summary of the Progress of Canada at the beginning of this volume.

<sup>1</sup> Revised since the publication of the 1939 Year Book.

**Acreages and Values, 1934-39.**—In the latest year the acreages under field crops increased by slightly over 2 p.c. and the value of the crops increased by 16.9 p.c., as indicated by the figures of Table 7.

The statistics of the principal field crops, shown in Table 8, have been augmented in this edition of the Year Book by the addition of a five-year average covering the years 1933-37. For the Dominion as a whole, peas and grain hay are the only crops showing a production under the average.

### 7.—Acreages and Values of Field Crops in Canada, by Provinces, 1934-39.

NOTE.—For earlier figures, see Statistical Summary at the beginning of this volume.

<sup>1</sup> Revised since the publication of the 1939 Year Book.

# 8.—Acreages, Production, and Values of Principal Field Crops of Canada by provinces, 1938 and 1939, with Five-Year Averages, 1933-37.

NOTE.—The figures for 1938 differ, in many cases, from those appearing in the 1939 Year Book owing to revisions in the estimates. Those for 1939 are subject to revision. Comparable figures for earlier years will be found in the corresponding table of earlier editions of the Year Book.

<sup>1</sup> Revised since the publication of the 1939 Year Book.

**Stocks of Grain in Canada.**—Table 10 shows the quantities of grain on farms at July 31, 1939, as compared with July 31, 1938 and 1937. Table 11 shows the total quantities of grain on farms at the end of the crop years 1930-39. The distribution of these crops will be found in the section of the chapter on internal trade that deals with the grain trade of Canada.

**10.—Stocks of Grain on Farms in Canada, as at July 31, 1937-39, with Totals of Production of the Previous Years' Crops.**

1925.....	98.0	102.5	93.7	91.0	102.1
1926.....	93.7	102.7	80.9	103.8	100.6
1927.....	94.3	103.8	90.1	107.8	108.3
1928.....	93.1	101.1	85.3	112.9	103.8
1929.....	93.1	98.5	87.9	120.1	101.1
1930.....	90.8	98.5	89.8	122.1	92.3
1931.....	85.8	90.2	78.7	119.8	108.4
1932.....	85.2	96.1	84.1	120.4	107.0
1933.....	82.3	98.8	88.6	111.9	87.7
1934.....	80.9	103.3	87.0	113.0	84.3
1935.....	80.8	102.9	85.0	112.3	81.9
1936.....	79.7	103.9	84.7	109.9	95.6
1937.....	79.5	105.4	83.8	110.3	91.4
1938.....	77.8	103.6	79.3	112.8	80.4
1939.....	77.9	103.6	78.7	111.2	99.1

The numbers of live stock and of poultry on farms, which were formerly shown in separate tables on a three- and two-year basis, respectively, are now shown on a ten-year basis in Table 14, while average values per head are shown for the six latest years in Table 15. Statistics for total cattle, geese, and ducks, together with total values for each kind of live stock, are given in the "Monthly Bulletin of Agricultural Statistics" for February, 1940.

**Wool Production.**—Of the total wool production in Canada for 1939, estimated at 17,888,000 lb., the Provinces of Alberta, Ontario, and Quebec accounted for the major part (nearly 70 p.c. of the 13,611,000 lb. of shorn wool). In Alberta, most of the wool comes from the sheep ranches, while in Ontario and Quebec it is produced by small farm flocks.

The outbreak of war in September caused an immediate change in the Canadian wool situation. Wool prices during the summer months had been at very low levels. However, the demand for wool increased enormously with the need for outfitting the

armed forces, and under the Wartime Prices and Trade Board prices were fixed at 45 cents a pound for domestic crossbred wool and tops. This order remained in effect until Jan. 27, 1940, when it was revoked and market prices were again established.

Although prices during the late fall months were much higher than in the previous year, the value of the 1940 clip was only \$123,000 higher than in 1938. This was due in part to the fact that most of the clip had been disposed of by farmers prior to September. Some advantage of the higher prices was, of course, gained by those producers marketing through co-operatives.

# 16.—Estimated Production, Exports, Imports, and Apparent Consumption of Wool in Canada, 1930-39.

<sup>1</sup> Revised since the publication of the 1939 Year Book.

**Production of Farm Eggs.**—The estimated production of farm eggs in 1938 was 6,044,000 doz. less than the production of 1937, a decrease of 2.8 p.c. The total value of the egg production of Canada registered a decrease of 5.6 p.c. as compared with the previous year. Complete data by provinces for 1937 and 1938 are given at p. 220 of the 1939 Year Book.

The export movement of eggs to British Empire markets has increased considerably in recent years. In 1938, 1,539,807 doz. eggs were shipped to the United Kingdom, representing 0.66 p.c. of the total production for that year; the total exports amounted to 1,842,538 doz. Imports have continued at a low level since 1930 when 2,908,340 doz. eggs were imported into the Dominion. In 1935 the imports amounted to only 26,842 doz. and in 1938 they increased to 33,534 doz.

Eggs have always been a relatively popular diet with the Canadian people. In 1938 the disappearance of eggs in the Dominion amounted to 233,471,546 doz. representing a per capita consumption of 20.83 doz. These calculations are made by adding the estimated production of farm eggs, eggs elsewhere produced, imports, and stocks at the first of January, and deducting therefrom the exports during the year, and stocks on hand at the end of the year.

#### Subsection 4.—Dairying Statistics.

In the present edition of the Year Book, revised statistics, based upon a more complete analysis of census figures, are presented for the years 1930-38, on a Dominion basis only. Figures for the provinces may be found in "Dairying Statistics for Canada, 1938", which carries the revision back to 1934, and in a special supplementary statement, issued in September, 1939, which covers the years 1930-33. Statistics for Canada and the provinces, covering the years 1936-38, appear at pp. 221-224 of the 1939 Year Book.

**Milk Production.**—The first milk production estimate was contained in the Census Report for 1911, showing a farm output of nearly 7,000,000,000 lb. in 1900 and slightly more than 9,750,000,000 lb. in 1910. The increase thus reported occurred during a ten-year period of extensive land settlement. During this period the number of farm holdings advanced approximately one-third, and breeding stock was shipped in large numbers to the western prairies to meet the needs of the new colonists.

In the course of the next decade (1910-20), a marked development took place in live-stock and dairying enterprises; since the quest for new lands had practically subsided, the number of farm occupants increased only 4 p.c. while the number of milk cows made a gain of 28 p.c. But the increase in milk cows was only partially reflected in the milk production estimate for 1920, which amounted to approximately 10,500,000,000 lb.

In the subsequent period (1920-30), the movement toward dairying was much more pronounced; the production of milk, as shown in the revised estimate for 1930, reached a total of over 13,000,000,000 lb., nearly double the amount produced at the beginning of the century. This increase was accompanied by a greater production per cow. In 1900, the average yield was 2,851 lb.; in 1920, it advanced to 3,189 lb.; and in 1930 to 3,578 lb. The production per farm also advanced; from an average of 13,436 lb. in 1900 it increased to 14,911 lb. in 1920, and to 17,605 lb. in 1930.

The increase in the total milk production in 1938 represented a gain of 2.9 p.c. over 1937. As compared with 1930, the increase was 20.6 p.c. This can be deduced from Table 18.

Of the total quantity of milk manufactured, 59.4 p.c. was used in the production of creamery butter, 23.4 p.c. in dairy butter, 12.9 p.c. in cheese, and 4.3 p.c. in concentrated milk products, ice cream, and farm-made cheese.

## 18.—Total Milk Production of Canada, 1930-38.

*Farm Value of Milk Production.*—Gross farm income from milk production in 1938, i.e., farm value less milk fed to live stock, amounted to \$144,000,000 while sales income was \$119,000,000, or 82·3 p.c. of the total farm value of milk production.

## 19.—Farm Value of Milk Production of Canada, 1930-38.

NOTE.—The data in this table are based on the values of whole milk on farms, the haulage costs for milk and cream being deducted from the plant values to obtain the figures shown.

Year.	Manufactured.		Milk Otherwise Used.			Total Value.
	On Farms.	In Factories.	Fluid Sales.	Farm Consumed.	Fed on Farms.	
	\$	\$	\$	\$	\$	\$
1930.....	20,469,000	60,261,000	40,480,000	12,954,000	6,934,000	141,098,000

1936.....	18,310,000	61,249,000	39,794,000	11,745,000	5,716,000	136,814,000
1937.....	19,387,000	66,118,000	39,810,000	12,321,000	6,058,000	143,694,000
1938.....	19,088,000	70,366,000	41,855,000	12,912,000	5,980,000	150,201,000

*Butter and Cheese.*—In 1938 creamery butter recorded an increase in quantity of 8·0 p.c. as compared with 1937, dairy butter a decrease of 2·8 p.c., and all cheese a decrease of 7·1 p.c. The cheese output, however, was still greater by 21·8 p.c. than that of 1934. The quantity of dairy butter for 1938 decreased slightly from that of the preceding year, but the increase in the creamery product more than compensated for the decrease. Cheese, on the other hand, recorded a decline of 7·1 p.c. in quantity between 1937 and 1938.

*Total Value of Dairy Production.*—The increase in the 1938 value of dairy production amounted to \$4,539,965, a gain of 2.1 p.c. as compared with 1937. Of the total value in 1938, creamery butter accounted for 30.0 p.c.; miscellaneous factory products, 11.4 p.c.; dairy butter, 9.5 p.c.; factory cheese, 7.5 p.c.; skim milk and buttermilk, 4.6 p.c.; and farm-made cheese, 0.1 p.c. Milk otherwise used, while the largest item, is made up of the milk sold as fluid, milk used on farms and milk fed to live stock. The percentages of the total were 28.3, 5.9, and 2.7, respectively.

Of the \$25,025,000 shown in Table 21 as the value of miscellaneous factory products, ice cream accounts for 42.2 p.c. of the whole and concentrated whole milk products for another 36.1 p.c. Statistics of quantities and values for each of the products included under this head are given for the years 1934-38, at pp. 11 and 12 of "Dairying Statistics for Canada, 1938", which may be obtained from the Dominion Statistician.

21.—Total Value of the Dairy Production of Canada, 1930-38.

Year.	Butter.		Cheese.		Miscellaneous Factory Products.	Milk Otherwise Used. <sup>1</sup>	Total, All Products. <sup>2</sup>

<sup>1</sup> Consists of milk sold for domestic use valued at plants, and milk consumed and milk fed valued at farms.

<sup>2</sup> The data in this column include the total value of skim milk and buttermilk. For all Canada this amounted to \$10,065,000 in 1938, \$9,814,009 in 1937, \$9,604,000 in 1936, \$8,462,000 in 1935, \$8,178,000 in 1934, \$7,617,000 in 1933, \$7,074,000 in 1932, \$11,381,000 in 1931, and \$12,503,000 in 1930.

*Consumption of Dairy Products.*—The consumption of butter in Canada in 1938 amounted to 356,797,062 lb., or 95.9 p.c. of the total production, and that of cheese was 40,555,515 lb., or 33.1 p.c. of the total production. The domestic consumption of all concentrated milk products was 71.0 p.c. of the total production.

The consumption of fresh milk, together with cream expressed as milk, reached a total of 4,300,000,000 lb., or 3,300,000,000 pints in 1938. This represented a daily consumption for the whole of Canada of 0.82 pint per person. It is important to observe that the milk producers supplying their own homes consumed 1.17 pints per day while those required to purchase their supply averaged only 0.70 pint per day.

On a per capita basis, the annual consumption of the various dairy products in 1938 was: milk and cream, 384.3 lb.; butter, 31.8 lb.; cheese, 3.6 lb.; evaporated milk, 6.7 lb.; condensed milk, 0.98 lb.; powdered milk, 2.0 lb.; and ice cream, 0.77 gal.

<sup>1</sup> "Farm" population refers to that part of the population located on farms where milk is produced.

<sup>2</sup> "Non-Farm" population includes the total urban population, plus that part of the rural population located on farms where there are no milk cows. In other words, the former group is composed of milk producers while the latter is composed of milk buyers.

**Exports and Imports of Butter and Cheese.**—*Butter.*—The export movement of Canadian butter has followed a more or less erratic course. The amounts exported from Canada were comparatively small until 1918 when shipments increased to nearly 11,000,000 lb. as compared with 4,250,000 lb. in the previous year. During the period 1915-18, exports averaged a little over 6,500,000 lb. per year, and the total for the four years represented 7.7 p.c. of the factory output. After the War of 1914-18 a more pronounced advance was recorded. In 1919 export shipments reached 16,500,000 lb.; while this declined substantially in the two subsequent years, a four-year period (1922-25) followed in which exports moved up to exceptionally high levels. The average was then approximately 21,000,000 lb. annually, and represented 12.6 p.c. of the creamery butter make. The all-time high was reached in 1925 when 26,500,000 lb. were shipped from Canadian ports. A sharp reduction followed. From 1927 to 1930 the yearly average was only about 1,750,000 lb.; in the period 1931-34 the average was 4,750,000 lb.; and from 1935 to 1938 the yearly average was nearly 5,250,000 lb. In 1935, the exports of 7,750,000 lb. were the highest since 1931 when nearly 11,000,000 lb. of butter were shipped out of Canada. In 1938 they fell to slightly below 4,000,000 lb.

The butter import movement has also revealed significant variations from year to year. From 1915 to 1918 the quantities of butter brought into Canada were exceedingly small, averaging 2,250,000 lb. per year, but in the next four-year period they had increased to an average of 3,250,000 lb. Commencing with the year 1926, imports moved to exceptionally high levels, and from 1927 to 1930 they averaged 25,750,000 lb., the highest figure being 38,500,000 lb. imported in 1930. Between 1931 and 1934, imports averaged only 1,750,000 lb. and from 1935 to 1938

tapered off to exceedingly small quantities. The only large movement in 1938 was the entry of nearly 5,250,000 lb., most of which came from New Zealand and Australia during the early spring when small stocks of Canadian butter resulted in seasonal price advances on the Canadian markets.

*Cheese.*—Exports of cheese have remained relatively constant. During the period 1915-18, they averaged 167,750,000 lb., and for the four years represented 89.9 p.c. of the cheddar cheese production. The high point in the export movement was reached in 1917 when over 176,250,000 lb. of cheese were shipped out of the Dominion. The decline in production, which developed more pronounced tendencies in the early 'twenties, was reflected in the movement of cheese to overseas markets. By 1929 less than 93,000,000 lb. were shipped out of Canada; in 1935 exports declined to less than 56,000,000 lb. During the period 1935-38, the yearly average was about 77,000,000 lb.—only 65.2 p.c. of the total cheese-factory output of Canada. In the past 20 years annual imports of cheese have averaged only one to three million pounds.

#### Subsection 5.—Horticulture.

The statistical treatment of horticulture is confined to fruit growing, nursery stock production, vegetable growing, and floriculture, all on a commercial scale. Of the several branches of commercial horticulture, fruit and vegetable growing are the most important. In recent years the latter has made remarkable gains and now surpasses fruit growing in total value of production. Vegetables and flowers grown in home gardens for private use probably exceed the volume of commercial production. The processing of fruits and vegetables is an important development closely allied to the production industry. In 1938, the latest year for which complete figures are available, the total value of processed fruits and vegetables, including wine, was almost \$52,000,000.

**Fruit Production.**—Apple growing is the mainstay of the fruit industry in Canada, the value of commercial production averaging about \$10,000,000 annually. Other fruits cultivated include the pear, peach, plum, cherry, apricot, and grape, together with various berries of which the strawberry is most important. Substantial revenue is derived from the native blueberry and cranberry, the former being abundant over large areas of Eastern Canada, while the cranberry is found chiefly in the Maritime Provinces. Commercial fruit growing is centred mainly in the Provinces of Nova Scotia, Ontario, and British Columbia. For a fuller discussion of fruit growing in Canada, the reader is referred to pp. 242-247 of the 1931 edition of the Year Book.

Revised statistics of the estimated commercial production of fruits in the years 1926-39 are presented in Table 23. The revisions have been made necessary by the fact that in previous estimates the quantity and value of the apples used for home consumption in Nova Scotia were not deducted, thereby rendering the statistics not comparable with those for the other provinces; minor revisions have also been made in the figures for other fruits.

Statistics by provinces will be found in the "Monthly Bulletin of Agricultural Statistics" for January, 1940, and in the "Annual Statistics of Fruit, Nursery Stock and Floriculture, 1939" published by the Dominion Bureau of Statistics.

### 23.—Estimated Commercial Production and Shipping-Point Values of Fruits in Canada, 1926-39, with Five-Year Averages, 1932-36.

NOTE.—All figures for apples, and certain figures for other fruits, have been revised since the publication of those in the 1937 and 1939 Year Books.

Revised statistics for the total value of commercial fruit production are given in Table 24. The 1939 figures indicate a reduction of 16.5 p.c. in value as compared with 1938.

**24.—Total Value of Commercial Fruit Production in Canada, by Provinces, 1926-39.**

**The Fruit Nursery Industry.**—The first commercial nursery in Canada was established near Fonthill, Ont., and this district still continues to be one of the leading centres of the industry. While the Province of Ontario accounts for the major part of the fruit stock output, there are nurseries distributed through all the provinces. The wholesale value of the product sold during the year ended May 31, 1939, showed a decrease of 12.1 p.c. as compared with the previous year.

**Vegetable Production.**—Satisfactory annual statistics of the commercial vegetable-growing industry are not at present available, but important information on the subject is obtained through the decennial census. This material will be found at pp. 254-255 of the 1936 Year Book.

**Floriculture.**—The total value of floricultural and ornamental nursery stock sold in Canada during the years ended May 31, 1938 and 1939, was \$2,976,940 and \$3,260,983, respectively, as shown by Table 26.

### Subsection 6.—Special Agricultural Crops.

**Maple Syrup and Sugar.**—The Canada Year Book, 1924, contains at pp. 247-248 a description of the process of making maple sugar.

Table 27 shows that in 1939 for the whole of Canada there were estimated decreases of 553,700 lb. of maple sugar and 653,100 gal. of maple syrup, while the combined value of the two products showed a decrease of \$406,000 or 10.5 p.c. as compared with the previous year.

**Sugar Beets and Beetroot Sugar.**—A brief account of the development of the beetroot sugar industry in Canada will be found in the Canada Year Book, 1925, pp. 255-256. At the present time two companies are operating in Canada: the Canada and Dominion Sugar Co., Ltd., with factories at Chatham and Wallaceburg in Ontario, and the Canadian Sugar Factories, Ltd., with plants at Raymond, and Picture Butte, Alta.

#### 28.—Acreages, Yields, and Values of Sugar Beets Grown in Canada and Quantities of Refined Beetroot Sugar Produced, 1929-38.

NOTE.—For the years 1911-20, see the 1932 Year Book, p. 1057; for 1921-28, see the 1933 Year Book, p. 257.

The production in 1936-37 of raw beet sugar in the principal beet-growing countries, in thousands of short tons, was as follows: U.S.S.R., 2,203; Germany, 1,992; United States, 1,396; France, 960; Czechoslovakia, 801; United Kingdom, 650; Poland, 505; Italy, 380; Sweden, 330; Belgium, 266; Netherlands, 259; Denmark, 249; Spain, 249; Austria, 161; Hungary, 158; Yugoslavia, 110; Ireland (Eire), 107.

**Tobacco.**—The 1939 commercial crop of Canadian leaf tobacco, estimated at 108,770,100 lb., is the largest crop on record in the history of the industry and is more than double the average of the ten-year period 1928-37.

The rapid expansion in the industry has been due almost entirely to the phenomenal increase in the production of flue-cured tobacco, particularly in Ontario where production of this type increased from 6,229,800 lb. grown on 7,550 acres in 1927 to 76,000,000 lb. on 64,630 acres in 1939. On the other hand, burley tobacco has shown wide fluctuations during the same period, production in 1939 amounting to only 14,166,600 lb. as compared with the peak production of 22,385,000 lb. in 1927.

Estimates of gross farm values are based on average farm prices. As a result of unfavourable marketing conditions and a sharp break in prices in 1931, values reached very low levels in 1932. Prices rose steadily over the next five years, partly as the result of increased prices for all types of tobacco but particularly because of the rapid expansion in the production of flue-cured tobacco, which commands a higher price than other types. Owing to the very large crops in 1938 and 1939, large stocks on hand, a fall in the sterling rate of exchange, and heavy restrictions on buying for export markets, the price paid for the 1939 crop continued the downward trend established in 1938.

## 29.—Acreages, Production, and Values of the Commercial Crop of Leaf Tobacco in Canada, 1929-39.

NOTE.—Figures for representative years 1900-28 are given at p. 228 of the 1939 Year Book.

	1939	4,595	1,236	5,680,200	9.3	528,000

<sup>1</sup> Revised since the publication of the 1939 Year Book.

**Flax Fibre.**—Table 32, compiled from information furnished by the Economic Fibre Production Division of the Dominion Experimental Farms, shows that the total value of flax division for fibre increased by \$730,349, or 140.8 p.c., in the latest year. The increase in the quantity of fibre produced is particularly noticeable and the certified seed sold on the Irish market realized more than \$2 a bushel over the 1933 prices.

### 32.—Acreages, Yields, and Values of Flaxseed, Fibre, and Tow in Canada, 1930-39.

NOTE.—Figures for the years 1915-29 will be found at p. 234 of the 1934-35 Year Book.

Year.	Area.	Production.			Values.			
		Seed.	Fibre.	Tow.	Seed.	Fibre.	Tow.	Total.

<sup>1</sup> No sales reported.

**Apiculture.**—Honey production is steadily increasing. The 1938 honey crop was of record proportions and of very good quality. The largest proportion of this production was in Ontario where a record crop estimated at 15,708,000 lb. of better-than-average quality honey was harvested. As evidence of the expansion that has taken place in this industry in the past fifteen years, the Ontario crop alone in 1938 was practically equal to the entire Canadian production in 1924. While production has increased in all provinces except Nova Scotia and New Brunswick, expansion since 1924 has been most marked in the Prairie Provinces. The combined production in these three provinces in 1924 amounted to 785,300 lb. and in 1938, it amounted to 14,752,100 lb. Honey produced in Western Canada is

of generally high quality due to the abundance of sweet clover in the Prairie Provinces. The almost phenomenal expansion in production in these provinces has been due largely to the introduction of sweet clover and the expansion in acreage of this crop.

Numbers of beekeepers and colonies have shown a gradual increase since 1924. This increase has been sharply marked in the Prairie Provinces, where there were over 8,000 beekeepers in 1938 reporting 97,000 colonies as compared with less than 2,000 beekeepers and 14,000 colonies in 1924.

The production of beeswax in 1938 was estimated at 446,850 lb. as compared with 286,650 lb. in 1937. The first estimate of the 1939 crop shows a total production of 27,911,500 lb. of honey and 334,900 lb. of wax.

While production of honey has more than doubled during the past fifteen years, prices have declined during the same period. The average price received by producers for the 1938 crop was estimated at 7·8 cents per lb. as compared with 9·0 cents per lb. in 1937 and 12·4 cents per lb. in 1924. Total value of production, including beeswax, was estimated at \$3,027,400 for the 1938 crop as compared with \$2,163,700 in 1937 and \$2,183,100 in 1924.

### 33.—Numbers of Beekeepers and Colonies, Production of Honey, and Values of Honey and Beeswax in Canada, 1924-38.

NOTE.—Statistics by provinces are shown in the "Monthly Bulletin of Agricultural Statistics", March, 1939, pp. 123-125.

## Subsection 7.—Farm Labour and Wages.

The material that formerly appeared under this heading has been transferred to Part II of Chapter XIX, Labour and Wages.

## Subsection 8.—Prices of Agricultural Produce.

The detailed monthly figures formerly given here have been omitted from the present edition of the Year Book. Weekly and monthly prices of grain and monthly prices of live stock are shown in the "Monthly Bulletin of Agricultural Statistics".

**Index Numbers of Agricultural Prices.**—Records of the average prices received by farmers for their crops have been collected annually since 1909 through crop correspondents. From these records, annual index numbers of prices have been calculated for each crop and for the field crops as a whole. The results of these calculations using the crop year 1926-27 as the base period, are presented in Table 37. In addition to the price indexes shown here, index numbers have been calculated of the yields of the various crops from year to year, and, by a combination of the prices and yields, index numbers of the values of all field crops, weighted according to quantities, have been obtained. Indexes of yields and values are given at pp. 29-38 of the "Monthly Bulletin of Agricultural Statistics", January, 1940.

The general index number fell from 1924 to 1928, especially from 1926 to 1928, recovered strongly in 1929 but declined rapidly to reach the record low of 43.1 for the 1932 crops. All the crops contributed to this sharp decline, although the grain crops dependent upon overseas markets suffered the most. In 1939 crop prices in the central and Maritime Provinces were generally higher than in the previous year, but the lower prices for wheat in the Prairie Provinces almost offset these gains.

The outbreak of war in September, 1939, naturally created a demand for comparisons with the prices of the pre-war crop year ended in 1914. The last two columns of Table 37, therefore, show the index numbers for the crop years 1938-39 and 1939-40 on the 1913-14 base. Both series are regularly published in the January number of the "Monthly Bulletin of Agricultural Statistics".

### 37.—Index Numbers of Farm Prices of Field Crops, for Canada, Crop Years Ended July 31, 1931-32 to 1939-40.

NOTE.—For the formulæ used in the calculation, see "Monthly Bulletin of Agricultural Statistics", January, 1940, p. 30. Comparable indexes for the years 1916-17 to 1930-31 are given at p. 236 of the 1939 Year Book.

#### Subsection 9.—Agricultural Statistics of the Census.

A summary of the more important agricultural statistics compiled from the Census of 1931 is published at pp. 295-301 of the 1934-35 edition of the Year Book. The review includes statistics of: tenure of farms; farm values; mortgage indebtedness; farm expenditures; farm population; farm workers; and cost of labour, farm machinery, and facilities. In the 1937 edition of the Year Book, further statistics are presented at pp. 270-273 that show, for the Prairie Provinces, comparative figures of population, farm holdings, areas, and values, the condition of farm land, the numbers of live stock, and the acreages of the principal crops, for each of the census years 1911, 1921, 1926, 1931, and 1936. In the Year Book for 1938, a summary table is given showing, by provinces, the part-time farm operators classified by the other occupations that are followed by some or all of the members of families, especially on small farms of insufficient size to furnish a livelihood. This year a survey of types of farms in the Prairie Provinces is made from data collected at the Quinquennial Census of the Prairie Provinces for 1936.

**Types of Farming in the Prairie Provinces, 1935.**—For the first time in the history of the Canadian Census, the 1936 Quinquennial Census of the Prairie Provinces attempted to classify the farms of the Provinces of Manitoba, Saskatchewan, and Alberta into types. Before 1921, census statistics were published by municipalities and by Electoral Districts. The Electoral District, which may change after every Parliamentary Redistribution, did not constitute a satisfactory unit of publication, and in 1921, the three provinces, not having counties like the eastern

provinces, were divided into permanent areas called Census Divisions. (See Population Chapter, p. 79).

The recent depression, serious drought, rust, and insect conditions in the Prairie Provinces have made it necessary for governments to study possible methods of developing types of farming suitable to each region. The municipalities and Census Divisions, established for administrative and political purposes, are not always suitable for such studies. One municipality may contain several distinct types of farming and, on the other hand, several municipalities may be uniform as to soil, climate, nearness to market, etc., with the majority of farmers following similar practices.

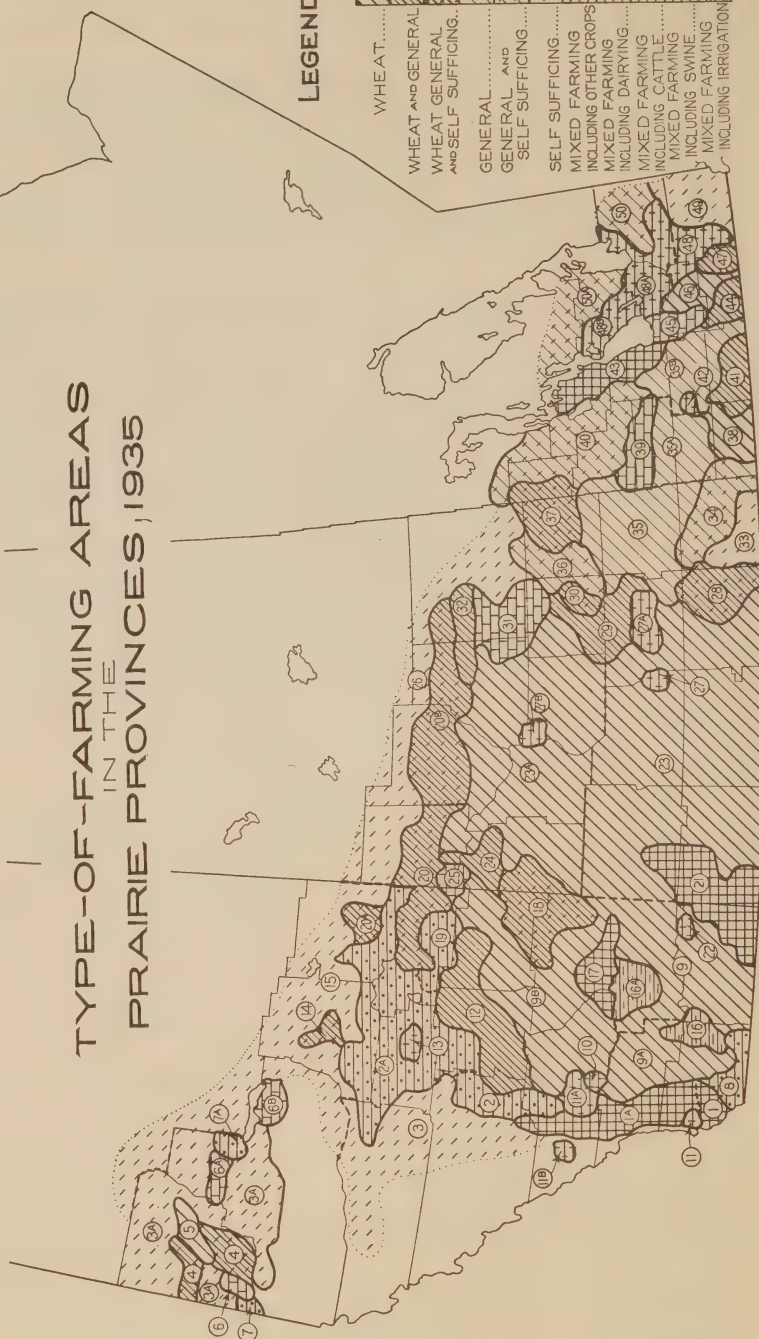

The map at p. 232 constitutes the first attempt at showing type-of-farming areas based on census data. The areas shown are based on source of income for the year 1935, and represent only conditions as they were in that year. It is quite certain that some areas classed as one type would fall in another in a year when different conditions prevailed. It is hoped that, by repeating this work in several succeeding census years, fairly accurate boundaries of the different areas will be located. Such repetitions will also show the changes in types of farming going on in the different regions. It is believed that the establishment of type-of-farming areas will be extremely useful as a basis for more detailed economic studies.

*Method of Analysis.*—The farms were classified into types through special questions on the value of products sold or to be sold in 1935, obtained on the census schedules. A questionnaire also asked for an estimate of the value of the products of the farm consumed in 1935 by the operator's household. In order that a farm be classified as one particular type, it was necessary that one particular source contribute 50 p.c. or more of the total value of products sold or to be sold or consumed by the operator's household. Where no one source was predominant, various combinations were used to classify the farms. In 1935, the following types where sales of the classified product reached this percentage were segregated:—

- (1) WHEAT FARMS
- (2) COARSE GRAIN OR OTHER CASH-CROP FARMS
- (3) HORSE FARMS
- (4) CATTLE FARMS
- (5) SHEEP FARMS
- (6) SWINE FARMS
- (7) MIXED LIVE-STOCK FARMS (where no one class of live stock made up 50 p.c. but where the sale of all classes of live stock together amounted to 50 p.c. or more).
- (8) ANIMAL PRODUCTS FARMS (Most of the animal products in this type came from dairying).
- (9) GENERAL FARMS (where the sale of no one item amounted to 50 p.c. of the total value of products sold or to be sold or consumed).
- (10) SELF-SUFFICING FARMS (where the value of products consumed by the operator's household amounted to 50 p.c. or more. It will be noted that these farms do not constitute self-sufficing farms in the strict sense of the term. This expression was used only because of the lack of a better one).
- (11) FOREST PRODUCTS FARMS
- (12) FARMS NOT REPORTING (Such farms are mostly 'non-resident' farms such as land leased for pasture, and other farms that do not come within any of the above-mentioned definitions as there were no products sold or to be sold or consumed off the farms).

# TYPE-OF-FARMING AREAS IN THE PRAIRIE PROVINCES, 1935

The type-of-farming areas were built up from the individual farm types. A particular type was considered predominant where it represented 45 p.c. or more of all the farms in that area. A combination type was differentiated where two types made up 60 p.c. or more of the total number of farms and no other type was equal to half of the lower of these two.

In some of the areas, wheat, general, and self-sufficing farms were of about equal importance and, if no other type was equal to one-half of the lowest of these three, they were designated as mixed type-of-farming areas. These mixed type-of-farming areas were named as such along with some other type that was of significant evidence in that area. Similar type-of-farming areas found in different parts of the three provinces were grouped together in the tables and called a type-of-farming class.

Besides the classification by type, the value of products by source, the distribution of the acreage in farms and in crops, and the concentration of live stock per 100 acres of occupied land were obtained for each municipality and used as checks in the classification of a municipality into a particular type.

The salient points of this study, which may be found in Bulletin No. XXXV of the 1936 Census of the Prairie Provinces, are summarized as follows:—

1. Climatic and economic conditions in the Prairie Provinces are such that, generally, farmers can follow only a limited number of enterprises.

2. Wheat is by far the most important crop in the three provinces. Oats and barley follow, the three crops occupying 90.0 p.c. of the total area of improved land. Cattle are the most important kind of live stock, with swine and sheep following in the order named.

3. Wheat farms constitute the most important single type of farm and are quite universally distributed throughout the three provinces. General farms and self-sufficing farms are next in importance, the three types forming 79.6 p.c. of all the farms. While farms reporting live stock and live-stock products sold are quite universally distributed, the number of specialized live-stock farms is relatively small. Animal products farms, mostly dairy farms, are located mainly around urban centres. Coarse-grain and other crop farms containing many specialized crop farms, such as sugar-beet farms, barley farms, etc., are found in specialized areas.

4. In 1935 the rust damage in southeastern Saskatchewan and southwestern Manitoba upset the normal system of farming in those areas. Farms that normally would have been wheat farms fell into the self-sufficing class because of crop failure in those areas.

5. One of the striking facts brought out by the study is the relation between the soil type and the type of farming, as illustrated by the fact that the boundaries of the type-of-farming areas coincide closely with the boundaries of soil-types. Broadly speaking, diversification increases as one proceeds from the brown to the black soils. In the grey wooded soils of the north most of the farms are classed as self-sufficing as they are in the pioneer stage, and the major part of their production is consumed on the farm.

## TYPE-OF-FARMING AREAS (AS NUMBERED ON THE MAP, p. 232).

NOTE.—In the areas where the types are mixed, each type is named in order of importance. Indian Reserves are not included.

Type of Farm.	Area Number.
Wheat.....	5, 9, 9A, 9B, 23, 23A, 38, 46.
Wheat and coarse grain.....	10.
Wheat and sugar-beet.....	16.
Wheat and general.....	24, 29, 32.

Wheat, general, and dairy.....	27.
Wheat, general, self-sufficing, and cattle.....	17.
Wheat, general, cattle, and self-sufficing.....	21.
Wheat, general, live-stock, and dairy.....	22.
Wheat, general, self-sufficing, and dairy.....	27A.
Wheat, general, self-sufficing, cattle, and swine.....	8.
Wheat, general, coarse grain, self-sufficing, and dairy.....	27B.
General.....	35, 35A, 35B.
General and self-sufficing.....	36, 40.
General and wheat.....	12, 41, 44, 47.
General, self-sufficing, and cattle.....	1A, 43.
General, self-sufficing, and coarse grain.....	6.
General, coarse grain, and self-sufficing.....	39.
General, coarse grain, and wheat.....	45.
General, self-sufficing, and wheat.....	30, 37.
General, self-sufficing, and dairy.....	48, 48B.
General, wheat, and self-sufficing.....	28.
General, wheat, self-sufficing, and swine.....	2.
General, wheat, self-sufficing, and coarse grain.....	31.
General, self-sufficing, swine, and wheat.....	2A.
General, self-sufficing, coarse grain, and dairy.....	48A.
General, dairy, wheat, and self-sufficing.....	11A.
General, dairy, self-sufficing, and coarse grain.....	13, 42.
General, wheat, self-sufficing, swine, and cattle.....	19.
Self-sufficing.....	3, 3A, 15, 26, 33, 49.
Self-sufficing and general.....	34, 50, 50A.
Self-sufficing, general, and wheat.....	14, 20A.
Self-sufficing, general, and swine.....	7A.
Self-sufficing, general, and dairy.....	11.
Self-sufficing, wheat, and general.....	4.
Self-sufficing, general, wheat, and cattle.....	1.
Self-sufficing, general, swine, and cattle.....	7.
Self-sufficing, general, coarse grain, and hay.....	6B.
Self-sufficing, coarse grain, wheat, and general.....	6A.
Coarse grain, dairy, and self-sufficing.....	11B.

## Subsection 10.—Miscellaneous Agricultural Statistics.

**Agricultural Irrigation.**—*Alberta.*\*—The surface waters in Alberta are vested in the Crown and are administered by the Water Resources Office under the Water Resources Act. All matters affecting the control of water supply generally, as well as the inspection and authorization of works for the use of water for domestic, municipal, industrial, irrigation, and other purposes, and the granting of licences for such purposes, are dealt with by that Office. The Director of Water Resources at Edmonton is responsible for all field administration. The Irrigation Districts Act of Alberta (c. 114, R.S.A., 1922) and amending statutes provide for the formation of irrigation districts, and authorize the raising of loans under by-laws adopted by the voters of the district.

\* Revised by L. C. Charlesworth, Director of Water Resources, Edmonton, Alta.

The Canadian Pacific Railway has constructed three large projects known as the Eastern, Western, and Lethbridge sections, the last-named being the oldest irrigation project in Alberta. In 1935 the interests of the C.P.R. in the Eastern project were transferred to the water contract holders, who are now operating under the name of the Eastern Irrigation District. By agreement with the Canadian Pacific Railway, the Taber, Magrath, and Raymond irrigation districts procure their water supply from the main canal of the Lethbridge section, a further 43,604 acres being served by the canals of these districts.

The total irrigable area served by the Canada Land and Irrigation Company's project is 130,000 acres, while the New West Irrigation District, by agreement with the Canada Land and Irrigation Company, received a water supply for a further irrigable area of 4,564 acres.

In addition to the irrigated tracts enumerated in the foregoing table, there are approximately 391 privately owned projects in Alberta, with a possible irrigable area of 57,751 acres.

*British Columbia.\**—The surface waters of British Columbia are vested in the Crown in the right of the Province and are administered by the Water Rights Branch of the Department of Lands under the Water Act, the Drainage Dyking and Development Act, and the Ditches and Watercourses Act.

The administration of the Acts is vested in the Comptroller of Water Rights. Under the provisions of the Water Act, 1909, the Board of Investigation or, as it was later known, the Water Board, was authorized to re-define the water records issued since 1858. Additional authority was given to the Board in administrative matters in later years, but owing to the enactment of the Provincial Public Utilities Act and to the fact that the re-definition of the more than 8,000 water records issued before the year 1909 had been completed, the Water Board ceased to exist with the enactment of the Water Act, 1939. It is interesting to note that of the orders of the Board re-defining the old records, only six were the subject of appeals to the Court of Appeal.

There are several forms of organization operating irrigation systems in British Columbia, and Table 39 gives statistics of the larger irrigation projects now in operation.

\* Revised by E. Davis, Comptroller of Water Rights, Department of Lands, Victoria, B.C.

<sup>1</sup> Most of the figures for 1938 have been revised since the publication of the 1939 Year Book. <sup>2</sup> Not available. <sup>3</sup> In the Southern Hemisphere the annual statistics are for the crop years 1938-39 and 1939-40, and the averages are for the period 1933-34 to 1937-38. <sup>4</sup> Including Austria and Sudetenland.

**World Exports and Imports of Wheat and Flour.**—During the crop year 1938-39, 678,582,000 bushels of wheat and wheat flour expressed in bushels of wheat were exported, as compared with 549,984,000 bushels in 1937-38.

In the latest year Canada was the leading country in the export of wheat, whereas in 1938 she occupied third place; Australia occupied first place in 1938 and United States second. In the export of flour Canada occupied third place in both years. Of the importing countries, the United Kingdom was the leader in imports of both wheat and flour in each year, while Belgium held second place in imports of wheat and the Netherlands in imports of flour.

#### 41.—World Exports and Imports of Wheat and Wheat Flour, Crop Years Ended July 31, 1937 and 1938.

NOTE.—This table is compiled from information published by the International Institute of Agriculture.

### Section 1.—Forest Regions.

The forests of Canada cover a vast region in the north temperate climatic zone, reaching from the Atlantic Ocean to the Pacific; they extend northward from the International Boundary to beyond the Arctic Circle. Wide variations in climatic, physiographic, and soil conditions cause marked differences in the character of the forests in different parts of the country, hence more or less well-defined forest regions may be recognized. The following principal regions are described separately: Acadian, Great Lakes-St. Lawrence, Deciduous, Boreal, Sub-Alpine, Columbia, Montane, and Coast. For descriptive purposes, it is convenient to consider two sections of the Boreal Region as separate entities, and they are described hereunder as the Northern Transition, and the Aspen Grove Sections.

**The Acadian Forest Region.**—This Region includes the Provinces of Nova Scotia and Prince Edward Island, and all but the northwest corner of New Brunswick. Its climate is characteristic of maritime regions, and is highly favourable to tree growth. Annual precipitation averages about 40 inches. Topography and geology are widely varied. In northern New Brunswick the maximum altitude is 2,700 feet above sea-level, and northern Cape Breton Island and parts of Nova Scotia are fairly rough. The surface of the remainder of the Region varies from level to gently rolling.

There is a general coniferous character to the Region, especially in the northern parts of New Brunswick and Cape Breton Island. Mixed forests, interspersed with so-called "hardwood ridges", are common, however, occurring more frequently in the southern parts of New Brunswick and Nova Scotia.

Among the coniferous species red spruce is the characteristic dominant, and is usually associated with balsam fir. White and black spruce, and white and red pine, are widely distributed. Jack pine occurs in pure stands on sandy plains. Hemlock, which is still to be found in most parts of the Region, is believed to have been much more important in former times. Other characteristic conifers are cedar and tamarack.

Yellow birch, maple, and beech occur in fairly large quantities and usually occupy well-drained ridges. White birch, wire birch, and poplar are found in association with the coniferous species. Among the other hardwoods are oak, butternut, basswood, ash, and elm.

\*Material in this chapter, with the exception of Section 4 appearing at pp. 251-258, has been prepared by R. G. Lewis, B.Sc. F., Chief of the Forestry Branch of the Dominion Bureau of Statistics, in co-operation with Roland D. Craig, F.E., of the Dominion Forest Service of the Department of Mines and Resources. Section 1 is based on Dominion Forest Service Bulletin No. 89, "A Forest Classification for Canada", by W. E. D. Halliday. The Forestry Branch of the Bureau of Statistics collects and compiles statistics relating to forest production and publishes four printed reports covering the lumber industry, the pulp and paper industry, and the wood-using and paper-using industries of Canada. These printed reports are usually preceded by a number of preliminary mimeographed reports, one for each important industry or group of industries. For detailed list of publications, see Chapter XXIX.

**The Great Lakes-St. Lawrence Forest Region.**—This forest, centring on the Great Lakes system, and extending eastward down the St. Lawrence Valley, is of an irregular character. It occupies a middle position between predominantly coniferous forests to the north and deciduous forests to the south. Precipitation varies from an annual average of 25 inches in the west to 45 inches in the east, and the growing season is from 100 to 150 days. Good forest soils of sedimentary origin are common, but southward extensions of the granitic areas of the Canadian Shield are also included within the boundaries of the Region.

The characteristic species are white pine, red pine, and hemlock, associated with the maples, yellow birch, and, in some sections, beech and basswood. Aspen, cedar, and jack pine are widely distributed, and spruce and balsam fir are common in certain localities. Among the less widely distributed hardwood species are white birch, elm, hickories, white and black ash, bur, red and white oak, ironwood, and butternut.

The pine forests of the Ottawa Valley and Algonquin Park have been famous as one of the greatest of Canada's lumbering areas. Elsewhere in the Region forests of mixed type predominate, with a considerable proportion of pure hardwood stands in the more favoured locations towards the south.

**The Deciduous Forest Region.**—This Region in Canada consists of a small northerly intrusion from the great forest of the same type in the United States, and occupies the southwestern portion of what is commonly referred to as the Ontario Peninsula. It enjoys very favourable climatic and soil conditions that permit of the growth of a number of tree species not found elsewhere in Canada. Because of its fertile soil, the area is completely settled, and the forests are now represented only by woodlots, parks, and small wooded areas on the lighter soils.

Among the characteristic trees are beech and sugar maple, together with basswood, red maple, and several oaks. Coniferous species are largely represented by scattered specimens of white pine, hemlock, and red juniper.

Among the less common hardwoods, which occur singly or in small groups, are hickories, black walnut, chestnut, tulip tree, magnolia, mulberry, sycamore, sassafras, black gum, Kentucky coffee tree, and a number of other species that find their northern limit in this Region.

**The Boreal Forest Region.**—This Region covers the greater part of the land area of Canada. It stretches unbrokenly from the Atlantic coast of Quebec westward to Alaska. Along its southern side it follows the limits of the Great Lakes-St. Lawrence Region, then skirts the open grasslands of the Prairie Provinces, and is terminated in the west in the foothills of the Rocky Mountains. To the north it is bounded by the limits of tree growth.

The principal trees of the Region are white and black spruce, balsam fir, poplars, white birch, and jack pine. Near the foothills of the Rocky Mountains the latter species is replaced by lodgepole pine. In Quebec and Ontario, and as far west as a line running from Lake Winnipeg to Lake Athabaska in the Prairie Provinces, the Region is, for the most part, underlain by granitic rocks of the Precambrian formations, known as the Canadian Shield. Within the area described there are extensive tracts of good soil, formed from glacial or sedimentary deposits, but a larger portion of the Region is characterized by shallow soils. Very considerable areas of bare rock testify to the disastrous results of forest fires followed by erosion. The forests of this part of the Region are mainly coniferous, with black spruce and balsam fir as dominants, and are valuable chiefly for pulpwood.

West of Lake Winnipeg the same tree species are in evidence but in different proportions. Here the soil is deep and relatively fertile, and the characteristic forest is a mixture of poplar and white spruce.

The climate of the Region is severe, and precipitation ordinarily varies from 15 to 30 inches annually, although these amounts are exceeded in eastern Quebec.

*The Northern Transition Section.*—This area is a part of the Boreal Region, but is described separately because none of its forests is of commercial value although of considerable local economic value. It represents a transition from the merchantable forests of the south to the treeless wastes of the Far North. White and black spruce, larch, and birch are the principal tree species, and these are usually of stunted growth because of the severity of the climate. In river valleys and other protected sites occasional clumps of trees of fair size are to be found. The principal economic value of the forests probably consists in the habitat they provide for fur-bearing animals, and the wood they furnish for fuel and buildings for the scattered inhabitants of the Region.

*The Aspen Grove Section.*—This Section, which lies entirely within the Prairie Provinces, is also a part of the Boreal Region, but has very special characteristics. It is a zone of transition between the true forest region to the north and the open grasslands to the south. Aspen is the dominant tree, and is in sole possession of most of the area. In southern Manitoba stands of bur oak are found, and elm, basswood, and ash occur singly or in small groups in river bottoms. Most of the area is farmed and much of the forest is now in the form of woodlots.

**The Sub-Alpine Forest Region.**—This is essentially a coniferous forest extending from the grasslands of the prairies and the western border of the Boreal Region up the eastern slopes of the Rockies to timber-line. This same type of forest reappears in a narrow strip extending northwesterly from the International Boundary between the plateaux of the Montane Region and the non-forested tundra formation of the mountain tops of the Coast Ranges.

In general, this forest formation occupies areas from 3,500 to 6,000 feet above sea-level. Rainfall is moderate, temperatures are low, and the growing season is short. The topography is mountainous with steep-sided valleys, and the soils are mostly derived from glacial and other residual material. The dominant tree species are Englemann spruce, alpine fir, and lodgepole pine. Less widely distributed are mountain hemlock, alpine larch, and white-barked pine.

**The Columbia Forest Region.**—This Region, often referred to as the Interior Wet Belt of British Columbia, supports forests that are somewhat similar in composition to those of the Coast Region.

The forests properly attributable to the Columbia Region comprise stands in the valleys of the Columbia and other rivers that lie between elevations of 2,500 feet and 4,000 feet above sea-level. Below this range occurs the Montane Region, and above it the Sub-Alpine. The climate is intermediate between those of the Coast and Montane Regions. The precipitation varies from 30 to 60 inches. The Region actually should be mapped as a series of 'islands' and 'stringers' surrounded by patches of sub-alpine forest; but it is impracticable to do this on so small a scale as is used for the map facing p. 248.

Some authorities consider the Columbia Region to be merely an extension of the Coast Forest Region. Because of the complete physical separation of the two

regions in Canada, and also because of important differences in environmental conditions, the division made here has been adopted.

The principal species in this Region are Englemann spruce, western red cedar, western hemlock, and Douglas fir. Among other species of considerable importance are alpine and grand firs, western white pine, and western larch. Lodgepole pine commonly replaces stands destroyed by fire. Black cottonwood is found on rich alluvial soils.

**The Montane Forest Region.**—This Region forms part of what is often termed the Interior Dry Belt of British Columbia. It occupies an extensive series of plateaux, valleys, and ranges in the interior of the Province, which extends northward from the International Boundary to the valley of the Skeena River. The climate is relatively dry, with low summer rainfall, and moderate to high temperatures. The driest conditions are found in the lower river valleys; here the forest gives way to open grassland.

The principal tree species are ponderosa pine, Douglas fir, lodgepole pine, and aspen. Towards the northern half of the Region ponderosa pine disappears and associations of Douglas fir and lodgepole pine become dominant. Towards the north and east, stands of Englemann spruce and alpine fir grade into the forests of the Sub-Alpine and Columbia Regions. Aspen is an important constituent of the northern parts of this forest.

**The Coast Forest Region.**—This Region includes the western slope of the Coast and Cascade Mountains and the insular system, the higher elevations of which form Vancouver Island, the Queen Charlotte group, and other islands along the coast.

The climate in this Region is mild and equable, with heavy precipitation varying from 40 to 200 inches per annum, about 70 p.c. of which falls during the autumn and winter months. These conditions are conducive to the luxurious growth of coniferous forests, and produce the largest trees and the heaviest stands in the Dominion.

The dominant trees are western hemlock and western red cedar. Associated with these are Douglas fir in the south and Sitka spruce in the north. All four of these species, of which the most important commercially is Douglas fir, grow to large sizes, and occasionally are found in stands running up to 100,000 ft. b.m. per acre. Other conifers that occur in the Region but are of much less importance include: yellow cedar; mountain hemlock; amabilis, grand, and alpine firs; and western white pine. Of the broad-leaved trees, several alders are widely distributed, and Garry oak and madrona are found in the vicinity of the Straits of Georgia. Broad-leaved maple and vine maple occur at low elevations in the southern sections, and black cottonwood, which is perhaps the most important hardwood from the commercial point of view, is found on alluvial soils in the valleys.

## Section 2.—Important Tree Species.

In Canada there are over 130 distinct species of trees. Only 33 of these are conifers or softwoods, but they comprise over 80 p.c. of the standing timber and 70 p.c. of the wood utilized for all purposes. Of the deciduous-leaved or hardwood species, only about a dozen are of commercial importance as compared with twice that number of conifers.

**Douglas Fir.**—The Douglas fir is Canada's largest tree and most important source of lumber and square timber. It is noted for its strength and durability and is used mainly in structural work.

**Spruce.**—There are five native spruce species, all of commercial importance, furnishing over one-quarter of the total production of lumber, ranking second to Douglas fir. Pulpwood made from spruce is preferred to other kinds and comprises two-thirds of the total quantity of pulpwood produced. Spruce is also used extensively for building construction, boxes, cooperage, and mining timbers. White spruce is the most abundant and most important commercially, comprising 41 p.c. of the wood used in manufacturing. Black spruce is of less value for lumber, being generally much smaller and often confined to swampy situations, but is considered superior for pulpwood.

**Pine.**—There are nine distinct pine species native to Canada six of which are of great commercial importance. Eastern white pine is especially valued on account of its softness, easy-working qualities, and low shrinkage. It has a wide variety of uses. This species was, up to a few years ago, the most important wood in Canada in point of quantity of lumber sawn and square timber exported, but now ranks third after Douglas fir and spruce. Western white pine has similar qualities and uses, but is less abundant. Red or Norway pine is stronger than white and is used for structural timber as well as for sawn lumber. Ponderosa or western yellow pine is used as a substitute for white pine but is more variable in quality. Jack pine and its western counterpart, the lodgepole pine, are used mainly for railway ties, poles, and rough construction.

**Hemlock.**—There are three hemlock species in Canada, two of which are valuable timber trees. The wood is used chiefly for railway ties, pulp, and construction.

**Balsam Fir.**—Four species of balsam fir are found in Canada. The wood is used extensively in the manufacture of wood-pulp and also as lumber.

**Cedar.**—Two species of cedar are found in Canada: white cedar, which is confined to moist situations in the East, and western red cedar, which grows to a tremendous size and is abundant in British Columbia. The wood is noted for its durability and low shrinkage and is used for all structural work exposed to the weather, such as shingles, building construction, especially greenhouses, railway ties, poles, and fence-posts.

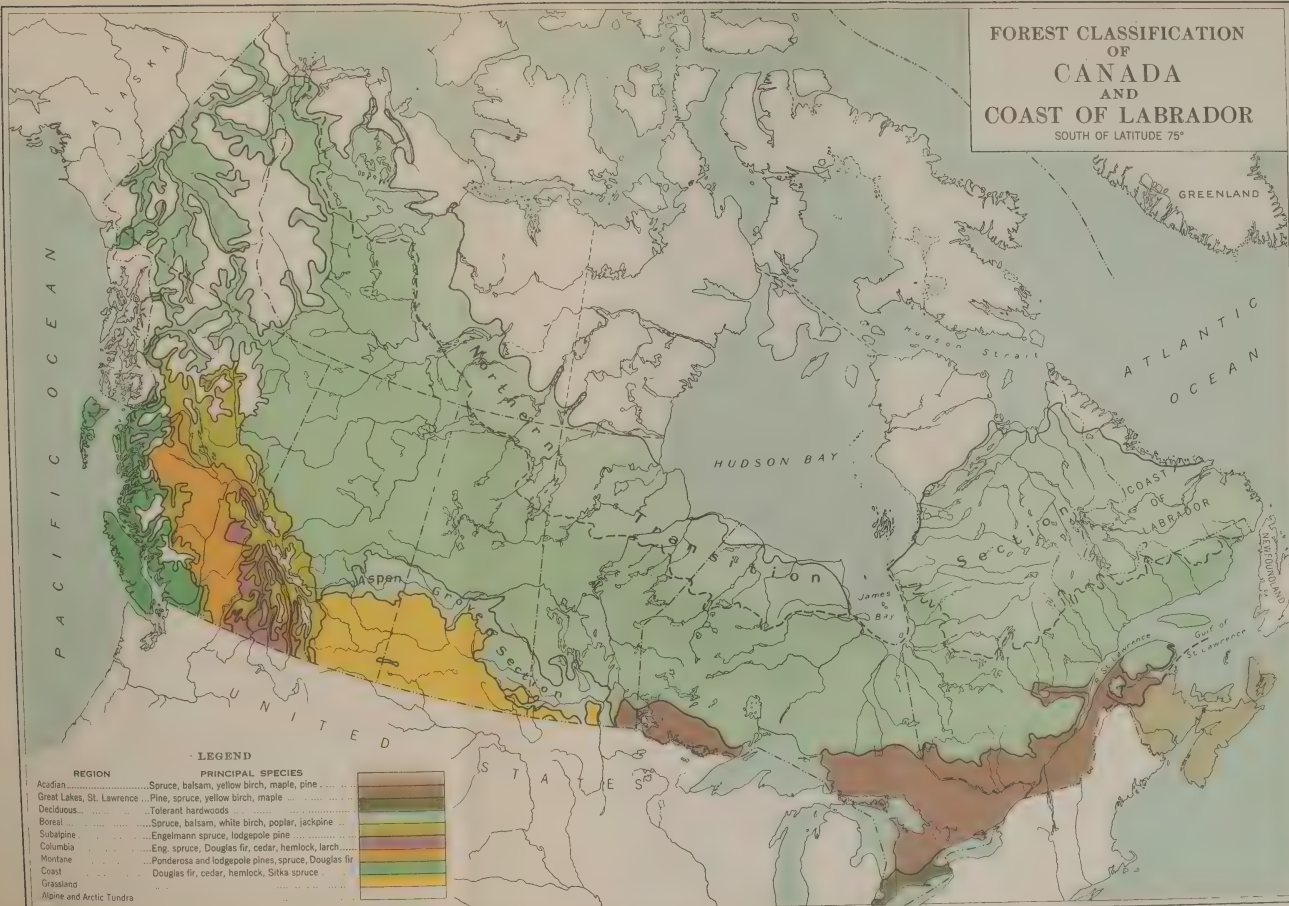

**Tamarack or Larch.**—The eastern tamarack is found chiefly in swampy situations. The western species, which grows on better sites and attains considerable size, is of more importance. The wood of these two species is cut into lumber and is used also for railway ties and in general construction.

**Birch.**—Birch is Canada's most important hardwood. While there are at least six native species, only two are worthy of note, viz., yellow and white birch. Yellow birch is in great demand for flooring, cabinet work, and interior finish. White birch is used for veneers.

**Maple.**—Maple is second in importance to birch as a hardwood. There are ten species scattered throughout Canada, of which the sugar maple, or hard maple, is the most important. The lumber of this species is used for flooring, interior finish, and cabinet work, while the tree itself is the source of the sap from which maple syrup and sugar are made.

**Basswood.**—Basswood, being soft and easily worked, is a valuable wood for certain kinds of cabinet making.

FOREST CLASSIFICATION  
OF  
CANADA  
AND  
COAST OF LABRADOR  
SOUTH OF LATITUDE 75°

**Minor Species.**—Elm, represented by three species in Canada, is a valuable vehicle wood. Beech, ash, oak, butternut, chestnut, red alder, hickory, yellow cedar, cherry, and black walnut are all valuable woods used for lumber in Canada, but, owing to scarcity, are of minor commercial importance.

The poplar species, of which there are seven native to Canada, are capable of producing great quantities of material that will eventually become more valuable when better types of hardwood are not so plentiful. They are now used principally for fuel, pulp, and match stock.

For a more extended description of the individual tree species, the reader is referred to pp. 283-286 of the Canada Year Book, 1936, and to Dominion Forest Service Bulletin No. 61, "Native Trees of Canada", published by the Department of Mines and Resources, where the subject is treated in detail.

### Section 3.—Forest Resources.

**Areas.**—The total land area of Canada, revised according to the latest surveys, is estimated at 3,466,556 square miles, of which 549,700 square miles is considered as being suitable for agricultural or pastoral purposes. About 254,873 square miles of this agricultural land is occupied and of this 213,236 square miles is classified as improved and under pasture and 41,637 square miles as forested.

As a result of the constant and inevitable improvement in conditions affecting profitable exploitation, such as the extension of settlement and transportation facilities, the increasing world scarcity of forest products, and the ever-increasing demand for these products, due to the development of industry, the discovery of new uses for wood, and the improvements in the methods, equipment, and machinery used in logging and manufacturing forest products, some of this inaccessible timber will eventually become commercially exploitable. It is estimated that of the accessible forest area 442,354 square miles is producing softwood or coniferous timber, 221,138 square miles mixed softwoods and hardwoods, and 105,971 square miles hardwood or broad-leaved species.

In Canada as a whole about 10.5 p.c. of the total forest area has been permanently dedicated to forest production. Of this total forest area, 8.5 p.c. has been permanently alienated, being owned in fee simple by private individuals or corporations. The Crown still holds title to 13.3 p.c. of the area, but has alienated the right to cut timber thereon under lease or licence. So far 78.2 p.c. has not been alienated in any way. It may be said that 91.5 p.c. of Canada's forest area is still owned by the Crown in the right either of the Dominion or the provinces and, subject only to certain temporary privileges granted to limit-holders, may at any time be placed under forest management and dedicated to forest production.

**Volume of Standing Timber.**—In 1938, the total stand of timber in Canada was estimated to be approximately 273,656 million cubic feet, of which 222,076 million cubic feet was of coniferous species and 51,580 million cubic feet of broad-leaved species. This estimate is the latest that has been made officially. It is difficult to divide the existing stand into merchantable timber and that which is inaccessible or unprofitable, since the merchantability depends not only on the location but on the density of the stand, the demands of the market for certain species or qualities of product, and the regulations as to cutting. Light stands covering large areas may in the aggregate carry very large amounts of timber

and still not be exploitable at a profit. For some species, such as aspen and white birch, which comprise three-quarters of the hardwoods, there is very little demand, and, therefore, these cannot properly be classed as merchantable, though accessible as far as location is concerned.

In June, 1929, a conference of the Dominion and provincial forest authorities was held in Ottawa, and it was decided to undertake a national inventory of the forest resources of Canada, each authority conducting the necessary stock-taking surveys on the land under its jurisdiction. In connection with the inventory, data are being secured regarding the depletion due to use, fire, insect damage, etc., and the increment accruing. The Forest Service of the Department of Mines and Resources acts as a clearing-house for the national inventory and, in addition to collecting and compiling the data furnished by the provincial authorities, has conducted the inventorial work in the Prairie Provinces and the Maritime Provinces. The inventories for Manitoba and New Brunswick have been completed and that of Nova Scotia is now in progress: aerial photography is used for forest mapping and volumetric estimates of the timber. The Dominion Service is also carrying on surveys to determine the increment taking place in the forests and conducting more intensive silvicultural research at forest experiment stations located in New Brunswick, Quebec, Ontario, Manitoba, and Alberta.

## Section 4.—Canadian Forest Resources: Their Relation to the War of 1914-18 and to the Present Effort.\*

In few countries is there such a variety of useful woods as in Canada. Of over 130 distinct tree species there are at least 35 of commercial importance; this is more a matter of amounts available than of the physical properties of the woods. Such species include woods suitable for the manufacture of practically every important wood product. In fact, for the principal uses, such as construction, pulp and paper, and fuel, there are Canadian woods that meet all the requirements.

Fortunately, more than three-quarters of the accessible timber is of "softwood" or coniferous species which are in the greatest demand for industrial purposes in both the domestic and foreign markets. There are, however, considerable quantities of "hardwoods" or broad-leaved trees which are of high quality for flooring, furniture, and other products demanding strength, hardness, and attractive appearance. These hardwoods also make excellent fuel. The relative proportions of softwoods and hardwoods coincide very closely with the demands.

### Canada's Resources in Timber—Depletion and Increment.

**Timber Resources.**—Canada has 783 million acres of forested land comprising more than 35 p.c. of the total land area. By way of comparison, only about 8.6 p.c. of the total land area is considered to be of value for agriculture, and only about 6 p.c. is now used for field crops or pasture. It is thought that perhaps 134 million acres now forested may have agricultural potentialities but the most productive use to which about 650 million acres can be devoted is the growing of forests. Not all of this forested area is capable of producing wood for commercial purposes; about 290 million acres being situated in sub-arctic, sub-alpine, or other unfavourable sites that preclude profitable timber growth or industrial utilization. These "unproductive" forests, however, have important influences on the climate and on the control of water supplies; they provide optimum natural habitats for wild life and wood for fuel and building material for the use of the local inhabitants, white and native.

About 493 million acres are considered accessible and capable of producing continuous crops of timber for domestic and industrial purposes. Of this productive forest area it is estimated that 47 p.c. carries timber of merchantable size, that is, large enough to be used now as pulpwood, cordwood, or saw logs. On the remaining 53 p.c. there is young growth of various ages, kinds, and degrees of stocking that has become established by natural reproduction on areas that have been either cut-over or burned-over or both.

The total stand of timber of merchantable size is estimated to amount to 273,000 million cu. ft., of which 170,000 million is considered accessible. Of the accessible timber about one-third (245,000 million bd. ft.) is large enough for saw material and two-thirds (1,100 million cords) is suitable for pulpwood, fuel-wood, posts, mining timber, etc. Much of this smaller material will attain saw-timber size if allowed to grow another 30 to 50 years but there are some stands growing on poor sites that cannot be expected to produce saw logs.

\* Prepared under the direction of the Dominion Forester by R. D. Craig, Chief, Economics Division, Dominion Forest Service, Lands, Parks and Forests Branch, Department of Mines and Resources, Ottawa.

**Depletion.**—The forestry situation in Canada is now distinctly promising in spite of the profligate manner in which the timber resources have been, or for that matter are, in some cases, still being treated. Having fallen heir to an apparently inexhaustible supply of timber, it is but natural that Canadians should have exploited it with little thought of succeeding crops. The urge to clear the land for settlement engendered carelessness with fire, which, under control, is a useful agent but, as a rule, it was allowed to extend far beyond the areas to be cleared.

During the ten years 1928-37, the average annual cut of timber for domestic and industrial use was equivalent to about 2,580 million cu. ft. of standing timber. It is perhaps not generally recognized that the principal use is for fuel, about 33.5 p.c. of the annual cut being utilized for that purpose. This amounts to about eight-tenths of a cord per capita and is equivalent to approximately 6,500,000 tons of anthracite coal. About 30.6 p.c. is used for the manufacture of sawmill products, including lumber, lath, shingles, etc., and 30 p.c. goes into the manufacture of pulp and paper. The remaining 5.9 p.c. includes hewn ties, posts, rails, mining timber, poles, and numerous other products. Only about 9 p.c. of this timber is exported in raw or unmanufactured state and 91 p.c. is either used for domestic requirements or was further manufactured before export.

The average annual loss from fire during these ten years is placed at 325 million cu. ft. of merchantable timber and the equivalent of practically the same amount of young growth. The annual loss due to insects and disease is estimated roughly at 700 million cu. ft., making a total annual depletion of 3,930 million cu. ft. of standing timber.

**Increment.**—The Dominion Forest Service and some of the provincial forest services and timber-owning companies have conducted investigations of increment and these indicate that, at least on the more favourable sites, the growth compares favourably with that secured in northern European countries, where an average of 25 cu. ft. or more per acre per annum is secured.

Investigations conducted in the various forest regions indicate that the natural reproduction of the principal species, both softwood and hardwood, is adequate to establish new stands, unless the forest has been subjected to very severe and repeated fires. Fire or the exclusive exploitation of one or more species may alter the composition of the stand temporarily and may cause local shortages of those species for a time, but natural reproduction can be depended on to replace them over a period provided seed trees are left. Artificial reforestation by seeding or planting has a definite, if limited, place in Canadian forestry in the rehabilitation of badly devastated areas, in the afforestation of lands mistakenly cleared for agriculture, and in the establishment and improvement of farmers' woodlots and shelterbelts.

It would therefore appear that there is sufficient timber of merchantable size to maintain the present annual cut and a reasonable amount of depletion from other causes until sufficient young growth attains merchantable size to meet the requirements. However, it must be remembered that it is necessary to have supplies of the kind of timber that industries require, located where they can be cut and delivered to the manufacturing plants at a cost that will enable products to be sold at a profit in the markets of the world. Then, too, the timber should be distributed in succeeding age-classes so that there will be a continuous accretion of merchantable timber.

# CANADA'S FOREST RESOURCES

—Continued

## Canada's Forest Resources

The layout on the opposite side of this insert, reading from left to right and downward for each section, shows:—

**Eastern Canada.**—(1) A Group of Sugar Maple in Ontario.—This species, also known as 'hard' or 'rock' maple, is abundant in Eastern Canada. It is used extensively for flooring, interior finish, veneer, plywood, and furniture and is also valued as the main source of maple syrup and sugar. (2) Young White Pine at the Petawawa Forest Experimental Station.—The original stand was logged about sixty-five years ago and was succeeded by dense reproduction. Thinning has stimulated the growth of the young trees. (3) Natural Reproduction of Spruce and Balsam Fir after Fire along the English River, Northern Ontario.—The conifers are now replacing the temporary poplar fire type. (4) Yellow Birch in the Ottawa Valley.—This is the most important hardwood in Canada from the standpoint of lumber production. It is used for flooring, interior finish, furniture, plywood, veneer, etc., and is abundant in the southern parts of Ontario and Quebec, and in the Maritime Provinces. (5) Hardwood Stand Typical of Eastern Canada Consisting of Maple, Birch, Beech, Basswood, and a few Pines and Hemlocks.

**British Columbia.**—(1) A Train-Load of Douglas Fir Logs at Courtenay, Vancouver Island, B.C.—From this point the logs are towed in rafts to the sawmills. (2) Sitka Spruce, Quatsino Sound, Vancouver Island, B.C.—This species produces the famous silver spruce, which is in such great demand for the construction of aircraft. (3) A Douglas Fir Log Being Sawed into Lumber for Export to the United Kingdom.—The high proportion of clear lumber secured from trees 300 to 400 years old will probably never be produced in succeeding stands.

The Layout to the left shows: (1) Logging Douglas Fir in British Columbia.—The size and weight of the logs requires heavy machinery for handling; they are being loaded on specially designed cars for transportation to the sea. (2) A Typical British Columbia Sawmill on the Fraser River near New Westminster. (3) Canadian Newsprint being Hauled Aboard a Freighter.—In 1939 Canada exported 2,658,689 tons of newsprint paper to forty-two principal countries. Canada supplies about two-thirds of the world exports of newsprint.

*Courtesy: E. J. Zavitz, Provincial Forester, Ontario; Royal Canadian Air Force; Leonard Frank, Vancouver, B.C.; and Dominion Forest Service, Ottawa.*

*Influences Operating Toward a Sustained Yield Basis.*—During the past two decades public education in fire prevention has made great progress and the efficiency of the fire control conducted by governmental and private protective organizations has increased to such an extent that annual losses from fire have been greatly reduced in spite of increasing hazards. That there is still room for great improvement in fire protection is evidenced by the fact that during the ten years, 1929-38, the records show that the average annual area of forest burned over amounted to 1,716,000 acres, including 551,000 acres of merchantable timber and 1,165,000 acres of young growth and cut-over land, involving the destruction of 833 million ft. b.m. of saw timber and over 2 million cords of other timber.

Another strong influence is the growing recognition of the importance of the young growth. Many stands of "second growth" which have come up after cutting or fire are now reaching merchantable size and are beginning to attract attention. Anticipating the need for practical guidance in the management of these accessible young forests, the Dominion Forest Service is devoting the major efforts of various forest experiment stations to the improvement of the quality and the acceleration of the growth of young stands that nature has established. Operators, too, are showing more interest in putting their operations on a self-sustaining basis and working plans are being developed with this in view.

Changes of great significance are taking place in the uses of wood which permit of the utilization of sizes and qualities that are unmerchantable for sawn lumber. The phenomenal development of the pulp and paper industry has provided a market for vast quantities of wood for which there was no demand twenty-five years ago and the development of the cellulose industry in the manufacture of rayon, cellophane, and numerous other products, is rapidly extending the use of wood. Plastic wood products, fibre board, and laminated wood will undoubtedly provide an increasing demand for these so-called "inferior" classes of wood so that more complete utilization of the forest resources and the elimination of much of the waste that now occurs can be expected. Though there may be a decrease in lumber production, owing partly to a decrease in high-grade timber and partly to the competition of other materials, there is every reason to expect that the demand for wood will be maintained if not increased.

Looking at the situation from a broad viewpoint, it may be said with confidence that with rational management there is no danger of an actual shortage of wood in Canada. There will undoubtedly be shortages in certain localities and of the higher grades of certain species such as will entail the readjustment of industry, but readjustments will come gradually and are, in fact, in progress.

### **Chief World Markets for Canadian Forest Products.**

Though Canadian lumber, pulp, and paper are normally exported to a great many countries, the United States and the United Kingdom provide by far the most important markets for these products. On the basis of value, the United States has been taking 67 p.c. and the United Kingdom 18 p.c., but in recent years the exports to the United Kingdom have materially increased in both actual and relative value.

## United Kingdom.

The United Kingdom is the greatest timber importing country in the world. Home-grown supplies are very limited and practically all the wood required for domestic use and for the great export trade must be imported.

The importance of wood in British economy, in war as in peace, is indicated by the promptness with which the Timber Control Board was established under the Ministry of Supply. This Board immediately took charge not only of the supplies in the British Isles but of the overseas purchases that had been made or were to be made.

The reasons for the establishment of the timber control are outlined by Mr. Russell Latham, Assistant Controller in Charge of Promotion of Economy in the Use of Timber, as follows:—

(1) The elimination of competition in those restricted markets that remain open as sources of supply.

(2) To enable any source of supply where timber operators show signs of exploiting the present emergency to be disregarded.

(3) The concentration upon imports of a type that are essential, as opposed to those that are not essential.

(4) To permit the regulation of expenditure of foreign exchange balances in accord with expediency.

The average annual imports of "Wood and Timber", classified under "Raw Materials and Articles mainly Unmanufactured" during 1934-38 amounted to the equivalent of 6,475 million ft. b.m. The imports of sawn wood, including box boards, averaged 4,964 million bd. ft.; and 151 million cu. ft. (which may be taken as equivalent to about 1,510 million bd. ft.) was imported in the form of hewn wood logs, pit-props, staves, poles, and veneers. Details are shown in the following statement:—

### AVERAGE ANNUAL IMPORTS OF WOOD AND TIMBER, 1934-38.

SAWN—	Equivalent in M ft. b.m.		Equivalent in M cu. ft., Wood Content.
Softwood—			
Not further prepared.....	3,624,861		
Planed.....	612,683		
Box boards.....	164,201		
Total Softwood.....	4,401,745		
Hardwood—			
Not further prepared—			
Mahogany, walnut, oak and teak.....	183,744		
All other sorts.....	258,900		
Planed.....	119,292		
Total Hardwood.....	561,936		
TOTAL SAWN.....	4,963,681		
		OTHER TIMBER—	
		Hardwood, hewn.....	4,075
		Softwood, round logs.....	12,735
		Softwood, <i>n.e.s.</i> .....	3,373
		Pit-props.....	106,872
		Sleepers, including sleeper blocks...	17,173
		Staves.....	2,624
		Telegraph poles.....	3,643
		Veneers.....	575
		TOTAL OTHER TIMBER.....	151,070

The value of this wood averaged £48,658,516, which, at the average prevailing rates of exchange, was equal to approximately \$240,618,000.

Of the 4,402 million bd. ft. of softwood lumber and box boards, European countries supplied 76 p.c., Canada 18 p.c., United States 2 p.c., and other foreign countries, some of which may be European, 4 p.c. The United States supplied

46 p.c. of the 562 million bd. ft. of sawn hardwoods, Canada 15 p.c., India, Australia, and other British countries 10 p.c., Poland and Yugoslavia 13 p.c., Japan 4 p.c., and other foreign and unspecified countries 12 p.c.

In addition to the above, there were imports of large quantities of pulp and paper and of manufactured wood in the form of doors, plywood, furniture, etc., that cannot readily be expressed in wood volume.

In spite of the almost complete cessation of construction for civil purposes due to restrictions imposed by the War, war requirements for buildings, containers, aircraft, and other essential purposes will be greatly increased. The exporting industries, which the Government is making every effort to maintain as a means to establishing essential foreign credits, will require wood for containers.

Canada and the United States can with little difficulty, if required, supply all the lumber the United Kingdom needs. Canada's normal production is about 4,000 million bd. ft. During the past five years the exports varied from 1,430 million in 1935 to 2,212 million in 1939, averaging 1,844 million bd. ft., of which 992 million went to the United Kingdom. The sawmill capacity is adequate to provide the United Kingdom with at least double that amount if orders are secured sufficiently in advance to get the logs cut and delivered.

In 1929 the United States produced 35,800 million bd. ft. of lumber of which about 3,000 million was exported. During the depression production was reduced to 13,100 million in 1932 but it has increased steadily to 25,547 in 1939, but only 1,050 million was exported. It is, therefore, evident that the exports from that country can be materially increased.

#### **Forest Products for which there will be a Substantial War Demand.—**

The situation in respect to three groups of forest products for which the normal channels of supply have been cut off, and which Canada is in a position to furnish, is reviewed below.

*Pit-Props.*—One of the most urgent demands of the United Kingdom at the present time is for pit-props. Normal imports amount to over 100 million cu. ft. About 70 p.c. has been coming from the Baltic countries, chiefly Finland, Russia, Latvia, and Sweden, and steps are now being taken to secure large quantities in Canada and Newfoundland.

*Aircraft Wood.*—The immense air programs of the British Empire and France call for large amounts of wood for aircraft construction, in spite of the increased use of metal for this purpose. The wood best suited for structural parts is Sitka spruce which grows on the Pacific Coast chiefly in Alaska, British Columbia, and Washington. Its light weight, strength, and resilience and the comparatively large proportion of clear straight-grained wood that can be secured from the large trees, usually 3 to 6 feet in diameter and 100 to 150 feet in height, make it of special value for this purpose. During the last year of the War of 1914-18, British Columbia supplied the Imperial Ministry of Munitions with 26,124 M ft. b.m., of Sitka spruce of aeroplane grade and 9,224 M ft. b.m., of high-grade Douglas fir for aeroplane construction. The high standard of quality required limits the selection to only a small proportion of the wood even in these large trees and, if the abnormal demands of war are to be met for a number of years, care must be taken to secure the maximum recovery of aircraft wood from the timber cut.

Yellow birch is being used extensively for aircraft largely in the form of plywood. The highest quality is required for this purpose also and though the supplies are large in the aggregate, they are scattered in mixed stands over considerable areas in Eastern Canada and a similar necessity for conservative utilization exists as in the case of Sitka spruce.

*Pulp and Paper.*—Practically all of the United Kingdom imports of wood-pulp, which, during 1934-38, averaged 2,298,000 short tons annually, came from European countries, mainly Finland, Sweden, Norway, Germany, Estonia, and Lithuania.

Imports of paper of all kinds averaged about 1,270,000 short tons of which 29 p.c. (mostly newsprint) came from British countries, and the remainder chiefly from European countries. Of the 462,700 short tons of newsprint in rolls, Newfoundland supplied 43 p.c. and Canada 29 p.c. The remaining 28 p.c. came mainly from Finland, Norway, and Sweden. Practically all of the 276,350 short tons of packing and wrapping paper originated in northern European countries. The Netherlands supplied over one-half of the paper and pulp boards of various kinds and Canada only 6 p.c.

As is indicated by the large amounts of wood-pulp imported, the United Kingdom manufactures a large proportion of the paper used. It is expected that, by curtailing consumption, the imports of paper can be considerably reduced, but with supplies from the principal sources cut off, it may be expected that more Canadian pulp and paper will be needed to meet requirements.

### United States.

It is not expected that the War will affect materially Canada's exports of lumber to the United States since United States imports from Europe have been insignificant in recent years. During the five years 1935-39 total imports averaged 500 million ft. b.m. annually.

The situation is different, however, in regard to pulp and paper. During 1934-38 the United States imports of wood-pulp averaged 1,988,353 tons, of which only 29 p.c. came from Canada and 71 p.c. was supplied from Europe, mainly from Sweden, Finland, Norway, Germany, and Czechoslovakia. Canada provided 77 p.c. of the 195,636 tons of mechanical pulp and all of the 9,709 tons of soda pulp, but only 27 p.c. of the 1,167,741 tons of sulphite pulp and 15.5 p.c. of the 615,267 tons of sulphate pulp.

During 1934-38 United States imports of standard newsprint averaged 2,587,248 tons of which Canada supplied 87 p.c., Newfoundland 4 p.c., and European countries, chiefly Finland, Sweden, Norway, and Germany, 9 p.c. Sweden and Finland provided practically all of the 13,826 tons of wrapping paper imported.

### Other Markets.

While the United Kingdom and the United States have, in the past, provided the principal markets for Canadian forest products, the trade with other British countries in which Canada enjoys preferential tariffs is of great, and in most cases, growing importance. Among these, Australia, New Zealand, South Africa, and the British West Indies may be mentioned particularly. Japan and China were both important buyers of Canadian lumber, pulp, and paper until war disrupted their trade. South America offers opportunities, especially for pulp and paper, that as yet have not been fully developed. In South Africa, South America, and

the Orient the northern European countries have been successful contenders in the trade in wood and wood products. Now that supplies from these sources are largely, if not wholly, cut off by the War, Canada may be in a position to extend her trade in these fields.

### Effects of the War of 1914-18 on Prices of Forest Products.

The War of 1914-18 had little direct influence on the forest industries, though the pulp and paper industry at that time was experiencing rapid expansion. It did not cause any marked decrease in lumber production, though a minor depression occurred in 1916. The cut in British Columbia decreased during the years 1914 to 1916, but recovered in 1917. In the eastern provinces production was well maintained throughout the period of hostilities.

During the five years previous to 1914 the value of sawmill products exported to the United States was more than twice as much as that to the United Kingdom (60.4 p.c. and 28.3 p.c. of the total, respectively). In 1934-38, however, the positions were reversed: 43.9 p.c. went to the United Kingdom and 39.4 p.c. to the United States.

Though there was a distinct slump in the exports of sawmill products to the United Kingdom in 1918, the average annual value during the fiscal years 1915-19 was slightly greater than during the previous five-year period. The exports to the United States continued to increase during the War.

The average price of lumber, which had been between \$15 and \$20 per M ft. b.m. for the previous nine years, began to rise in 1917 and continued its upward trend until 1920, when it touched \$39.10. After that a steady decline set in and the lowest point of \$14.15 was reached in 1933. Since that time there has been a gradual increase in price to \$20.67 in 1937.

The production of pulpwood, wood-pulp, and paper increased steadily from 1908 to 1920. Following a slump in 1921, it continued to increase up to 1929.

The average price of pulpwood increased steadily from \$5.84 per cord in 1908 to a peak of \$16.16 in 1921.

The price of chemical pulp remained fairly steady at from \$38 to \$39.50 per ton until 1916, when it jumped to \$51 and in 1917 to \$73. The peak of \$114 was reached in 1920. In 1921 it fell to \$68 and gradually decreased to less than \$45 in 1933. Mechanical pulp followed a similar course.

The price of newsprint also rose sharply during the War culminating at \$98.40 in 1921, followed by a consistent decline to \$34.15 in 1935.

It is not evident that the War of 1914-18 had any direct effect on either the volume of production or the price of pulpwood, pulp, or paper, except that increased wages may have provided some excuse for raising prices. The demand for pulp and paper was increasing rapidly in the United States and a boom developed in Canada to meet, or anticipate, this demand. The consequences of this boom are still being felt by the industry and every precaution should be taken to avoid a recurrence of such a condition based on the temporary opportunities afforded by the present emergency.

### Conclusion.

Since the outbreak of the present War in September, 1939, it has become increasingly evident that Canadian forests and forest industries will be depended upon to

supply not only the major part of the requirements of the United Kingdom for forest products, but also increasing amounts to other countries that have been securing supplies from the northern European countries. Exports from the countries on the Baltic Sea have been practically eliminated and the increased freight and insurance rates resulting from the indiscriminate submarine and mine warfare by Germany has seriously dislocated the trade even of those countries that have direct access to the Atlantic. Large quantities of lumber, pit-props, pulp, paper, and other wood products are normally exported from Finland, Sweden, Russia, Latvia, Estonia, and Lithuania not only to the United Kingdom and other European countries, but to the United States, South America, South Africa, Australia, and Asiatic countries.

It is evident that, in this War, material resources will play an even more vital part than in previous wars. It is fortunate, therefore, that Canada possesses such vast supplies of accessible timber and industries that are capable of expanding their production to meet a very considerable increase in the demand for forest products. It is fortunate too that Canadian seaports on both the Atlantic and the Pacific are open throughout the year and, with the convoy system in operation, overseas shipments can be made with comparative safety.

It is of vital importance to Canada that trade in forest products be maintained since it provides a greater favourable balance than the trade in any other class of products. In order that this may be accomplished, total depletion must be kept within the productive capacity of the forests. There is no reason why this cannot be done if the forests are managed on a rational basis.

The abnormal demands of the present conflict should not cause serious inroads on forest capital. The necessity for economy in use, the limitation of shipping space, and rigid control of prices should prevent anything in the nature of a boom developing.

## Section 5.—Forest Administration.

### Subsection 1.—Administration of Dominion and Provincial Timber-Lands.

In Canada the general policy of both the Dominion Government and the Provincial Governments has been to dispose of the timber by means of licences to cut, rather than to sell timber-land outright. Under this system the State retains ownership of the land and control of the cutting operations. Revenue is derived in the form of stumpage bonuses (either in lump sums or in payments made as the timber is cut), annual ground-rent, and royalty dues collected as and when the wood is removed. Both ground-rent and royalty dues may be adjusted at the discretion of the Governments so that the public may share in any increase in stumpage values, or reductions may be made in the rates if conditions demand them.

The Maritime Provinces did not adopt this policy to the same extent as did the rest of Canada. In Prince Edward Island practically all the forest land has been alienated and is in small holdings, chiefly farmers' woodlots. In Nova Scotia 87 p.c. of the forest land is privately owned; nearly half of this is in holdings exceeding 1,000 acres. In New Brunswick over 50 p.c. has been sold, and 20 p.c. is in holdings exceeding 1,000 acres. The percentage of privately owned forest land in the other provinces, exclusive of National Parks and Indian reserves, is as follows: Quebec, 8 p.c.; Ontario, 3.3 p.c.; Manitoba, 9.1 p.c.; Saskatchewan, 7.6 p.c.; Alberta, 7.7 p.c.; and British Columbia, 8.4 p.c. With the exception of relatively

small areas owned by the Dominion Government, the Crown lands and the timber on them are administered by the provinces in which they lie. As new regions are explored, their lands are examined and the agricultural land disposed of. Land suitable only for forest is set aside for timber production, and the policy of disposing of the title to lands fit only for the production of timber has been virtually abandoned in every province in Canada. The ownership of forests by towns and communities, so common in Europe, is now beginning in Canada. Efforts are being made, especially in Quebec and Ontario, to encourage the establishment and maintenance of forests on this basis.

## FOREST RESERVES AND PARKS IN CANADA, 1940.

Totals.....	237-90	12,403-03 <sup>2</sup>	108,526-78	18,690-58 <sup>1</sup>

<sup>1</sup>In addition, 532-82 sq. miles of Provincial Forest Reserves in Saskatchewan are administered under provincial park regulations.

<sup>2</sup>Not including Wood Buffalo Park, comprising 17,300 sq. miles, which is partly in Alberta and partly in the Northwest Territories, and is administered by the Bureau of Northwest Territories and Yukon Affairs.

**Forest Lands Under Dominion Control.**—The forests under Dominion control are administered by the Department of Mines and Resources. The National Parks Bureau has charge of the National Parks, the Lands Registry Office administers the timber in Yukon and the Northwest Territories, and the Indian Affairs Branch administers, in trust for the Indians, the timber within their reservations. The Dominion Forest Service has charge of the Forest Experiment Stations.

**Forest Lands Under Provincial Control.**—*Nova Scotia.*—In this Province, 10,473 square miles, about 87 p.c. of the forest land, is privately owned. The Crown timber is administered by the Minister of Lands and Forests, with a Chief Forester in charge of protection, surveys, etc. Timber-cutting leases are granted by special agreements.

*New Brunswick.*—The Forest Service, under the Department of Lands and Mines, administers the forests in New Brunswick. At present timber-lands are disposed of as in the other provinces, but in the past several grants of forest land were made to railway companies, private concerns, and individuals, who now own in fee simple 11,159 square miles of forest land.

*Quebec.*—The Forest Service of the Department of Lands and Forests administers the timber-lands in Quebec. Its powers include classification of land, disposal of timber, and regulation of cutting operations. Since 1924 forest protection has been under a separate organization, the Forest Protective Service. Licences are granted after public competition and are renewable from year to year, subject to changes in royalty by the Government at any time. Grants of land in fee simple, made in some cases under the French *régime* in Quebec, are responsible for the private ownership of about 31,048 square miles of forest land. Forest reserves cover 32,115 square miles and provincial parks 5,160 square miles.

*Ontario.*—Forest administration is carried out in Ontario by the Department of Lands and Forests, under a Minister, Deputy Minister, and Provincial Forester. In recent years the sale of saw timber has been by tender after examination, with conditions covering the removal within a specified period, disposal of debris, etc. Much of the merchantable timber is at present held under licences granted in the past and renewable indefinitely. Pulpwood areas are usually disposed of by individual agreements for longer periods than in the case of saw timber. The licensees usually undertake to erect a pulp-mill or a paper-mill within the Province, the type and size of mill being stipulated in the agreement. In this Province about 7,972 square miles of forest land have been disposed of outright. Provincial forest reserves cover 19,606 square miles, and the provincial parks 4,248 square miles.

*Manitoba.*—The Forest Service of the Department of Mines and Natural Resources has administered the forests of Manitoba since 1930. A provincial air service is operated under the direction of the Provincial Forester, and is used mainly for purposes of forest fire protection. Six forest reserves, containing 3,775 square miles, are reserved permanently for the production of forest products. Timber is disposed of by licence or timber sale, and large numbers of timber-permits, covering small quantities of wood, are issued annually to settlers and others. One pulp and paper mill is in operation in the Province. The area of privately owned forest land is estimated to be 8,500 square miles.

*Saskatchewan.*—The forests of Saskatchewan are administered by the Department of Natural Resources. The organization is unique in Canada, because the different resources are not controlled by different branches of the Department. Instead, each field officer handles matters pertaining to all resources within his district. Forestry affairs of the Department are controlled by the Director of Forests. Timber disposal is carried out under licence, sale, and permit. An air service is maintained, mainly for forest protection purposes. Forest reserves occupy 10,223 square miles and provincial parks 1,146 square miles. Privately owned forest land is estimated to be 6,250 square miles.

*Alberta.*—The Forest Service of the Department of Lands and Mines administers and protects the provincial forests. Timber is disposed of through licences and permits except on forest reserves, where timber sales are disposed of but licensed berths are not. The area in forest reserves is 14,316 square miles, and 10,044 square miles of forest land are privately owned.

*British Columbia.*—In the Province of British Columbia, the Forest Branch of the Department of Lands has administered timber-lands since 1912. All unalienated lands in the Province that are found to be better suited to forest than to agricultural production are dedicated to the former purpose, and all timber-lands carrying over a specified quantity of timber are withdrawn from disposal until

examined by the Forest Branch. During the past few years 28,400 square miles have been set aside permanently for forest purposes. Provincial parks include 8,134 square miles. The present practice is to sell cutting rights for a stated period by public competition but licences to cut, which are renewable annually in perpetuity, have been granted for a large proportion of the accessible timber. The royalties are adjusted periodically on the basis of prevailing industrial conditions. About 15,000 square miles of timber-land are privately owned.

### Subsection 2.—Forest Fire Protection.

The protection of forests from fire is undoubtedly the most urgent and most important part of the work of the different agencies administering forest lands in Canada. Except for the forests of the National Parks, the Forest Experiment Stations, and the Northwest Territories and Yukon, which remain under Dominion control, the administration of forest lands now rests with the provinces. Up to the end of the fire season of 1930, the Forest Service of the former Dominion Department of the Interior was responsible for fire protection in the prairie provinces of Manitoba, Saskatchewan, Alberta, and in the Railway Belt of British Columbia. However, by reason of the transfer of natural resources from Dominion to provincial control, their administration now rests with the provinces concerned.

Each of the Provincial Governments, except that of Prince Edward Island, maintains a fire protection organization co-operating with owners and licensees for the protection of all timbered areas, the cost being in part distributed or covered by special taxes on timber-lands. In each province, with the exception just mentioned, provincial legislation regulates the use of fire for clearing and other legitimate purposes, and provides for close seasons during dangerous periods. An interesting development in this connection in the Province of Quebec is the organization of a number of co-operative protective associations among lessees of timber-limits. These associations have their own staffs which co-operate with those of the Board of Railway Commissioners and the Provincial Government. The latter contributes money grants and also pays for the protection of vacant Crown lands lying within the area of the associations' activities.

In the matter of forest fire protection along railway lines, the provincial services are assisted by the Dominion Railway Act administered by the Board of Railway Commissioners. This Act gives to that body wide powers relating to fire protection along railway lines under its jurisdiction in Canada. Certain officers of the various forest authorities are appointed ex officio officers of the Board of Railway Commissioners. These officers co-operate with the railway fire-ranging staffs employed by the various railway companies, the compulsory control of all lines coming under the jurisdiction of the Board being one of the requirements of the Dominion Railway Act.

One of the most important single developments of recent years in forest fire protection has been the use of aircraft for the detection and suppression of incipient forest fires. Where lakes are numerous, flying boats can be used for detection and for the transportation of fire fighters and their equipment to fires in remote areas. Specially constructed aircraft equipped with wireless are employed on forest fire-protection operations; these enable the observer to report the location of a fire as soon as it has been detected. As a general rule, aircraft are used in the more remote districts, while lookout towers, connected by telephone lines or equipped with wireless, are established in the more settled and more travelled forest areas. While these agencies have to a large extent supplanted the old canoe, horseback, and foot

patrol for the detection of fires, a large ground staff with its equipment stored at strategic points will always be necessary for the fighting of larger fires. A ground staff is also necessary for the maintenance in the forest of fire lanes, fireguards, and systems of communication and transportation.

The most important improvement in forest fire-fighting equipment has been the portable gasoline pump. These pumps, each of which weighs from 45 to a little over 100 pounds, can be carried to a fire by canoe, motor-boat, automobile, aircraft, pack-saddle, or back-pack. They can deliver efficient water pressure as far as seven thousand feet from a water supply and, when used in relays, to a much greater distance. Small hand-pumps supplied by 5-gallon portable containers are also used effectively in many cases.

In addition to these improved measures, the enactment of legislation has tended to reduce the fire menace. The establishment of close seasons for brush-burning, and seasons during which permits are required for setting out fires and for travel in the forest during dangerous dry periods, have been of enormous value as preventive measures.

Since its beginning in 1900, the Canadian Forestry Association has played an important part in securing popular co-operation in reducing the fire hazard. By means of its magazine, which has a circulation of over 16,000, by railway lecture cars and motor trucks provided with motion-picture equipment, and by co-operation with radio broadcasting stations and the press, the Association reaches a large proportion of the population of the Dominion. Special efforts are made through the schools, by specially appointed junior forest wardens and other means, to educate the younger generation as to the value of the forests, the devastation caused by fire, and the means of preventing such destruction.

Prepared lectures illustrated by slides and films are distributed to volunteer lecturers and other educational work is carried on in schools and at public meetings. The various governmental forest authorities also carry on forest conservation publicity work independently and in co-operation with the Canadian Forestry Association.

Another important advance in forest protection is the development by the Dominion Forest Service of methods for the daily measurement of the actual degree of forest-fire hazard which is expressed in the form of an index computed from the weather factors. In the forest types and regions in which the necessary research has been completed the forest authorities are able, not only to gauge the trend of increasing hazard at any given time but, by the aid of weather forecasts, to anticipate the trend one or two days in advance and so regulate their activities to meet hazardous conditions as they develop.

### Subsection 3.—Scientific Forestry.

Up to the present, the practice of forestry in Canada has consisted chiefly in the administration and protection of existing forest areas. About 35 square miles is now being planted out annually, largely in connection with farmers' woodlots, shelter-belts, and reclamation work, while several commercial reforestation projects have been carried on by paper companies and by Provincial Governments on denuded Crown lands. The great forestry problem, however, is the management of Crown forests, first under provisional and later under more intensive working plans, so as to ensure a sustained yield. To this end, forest research activities are now assuming great importance. A special article on scientific and industrial research including information on forestry research appears in Chapter XXV.

About 400 technically trained foresters are employed by the Dominion or provincial forest services or by paper and lumber companies. A considerable number of foresters are actively engaged in commercial logging operations. In addition to administrative work, these men carry on forest surveys either for the estimation of timber-stands and making of maps, or to determine natural growth and reproduction conditions and factors. An outstanding development of recent years has been the extensive use of aerial photography for forest surveys. With the co-operation of the Royal Canadian Air Force and the Topographical Survey, the Dominion Forest Service has taken a leading part in the development of means for the interpretation of the photographs for forestry purposes, but most of the provincial forest services and many of the timber-owning companies make extensive use of aerial photographs. It is now possible not only to map the areas covered by the various forest types but to estimate the volume of standing timber with an accuracy that compares favourably with ground surveys. Over 950,000 square miles have now been photographed in Canada and of this area forest maps have been prepared for 110,000 square miles.

## Section 6.—Forest Utilization.

Certain aspects of forest utilization are dealt with in Section 4 appearing at pp. 251-258—"Canadian Forest Resources: Their Relation to the War of 1914-18 and to the Present Effort".

### Subsection 1.—Woods Operations.

Differences in forest conditions throughout Canada give rise to differences in logging methods. Generally speaking, throughout Eastern Canada the climate is such that the cutting and hauling of logs can be carried on most economically during the fall and winter months. The trees are felled and the logs hauled to the nearest stream or lake, where they are piled on the ice or sloping banks. The presence of connected systems of lakes and streams makes it possible in most cases to float the logs from the forest to the mill at a minimum cost during the annual spring freshets. The logging industry east of the Rocky Mountains is, therefore, almost entirely seasonal. In many cases lumbermen co-operate in river-driving operations and improvement companies, financed by the logging operators, build river improvements to facilitate the passage of the floating logs, the logs being finally sorted and delivered to their respective owners. In British Columbia the scarcity of drivable streams and the greater average size of the logs give rise to entirely different logging methods. Logs are assembled by cable systems operated by donkey engines and are transported to the mills or to water chiefly by logging railways but in many cases by motor trucks. These operations are more or less independent of frost, snow, or freshet and are carried on in most cases throughout the year.

In Eastern Canada logging operations are usually carried on by the mill owners or licensees of timbered lands, often through the medium of contractors, subcontractors, and jobbers. In the better-settled parts of the country a considerable quantity of lumber is sawn by custom sawmills or small mills purchasing logs from the farmers. Unmanufactured pulpwood, poles, ties, and other forest products have a market value but sawlogs, being as a rule the property of the mill owner, are not generally marketed as such in Eastern Canada. In British Columbia logging is carried on more frequently as a separate enterprise by limit-holders, who cut and sell logs on the market. In many cases mill operators are not limit-holders but buy their entire supplies of raw material from logging concerns.

In connection with operations in the woods it should be borne in mind that the forests not only provide the raw material for the sawmills, pulp-mills, wood distillation, charcoal, excelsior, and other plants but that they also provide logs, pulpwood, and bolts for export in the unmanufactured state, and fuel, poles, railway ties, posts and fence-rails, mining timber, piling, and other primary products, which are finished in the woods ready for use or exportation. There are also a number of minor forest products, such as Christmas trees, maple sugar and syrup, balsam gum, resin, cascara, moss, and tanbark, which all go to swell the total.

The exports and imports of forest products in the fiscal years ended Mar. 31, 1936-39, are shown in Tables 12 and 13 of the chapter on External Trade.

## 2.—Values of Woods Operations, by Products, 1933-37.<sup>1</sup>

Product.	1933.	1934.	1935.	1936.	1937.

<b>Totals.....</b>	<b>93,773,142</b>	<b>105,539,732</b>	<b>115,461,779</b>	<b>134,804,238</b>	<b>163,249,887</b>

<sup>1</sup>The total value of woods operations in 1938 was \$148,265,857.

It has been estimated that operations in the woods in Canada in 1937 involved the investment of over \$200,000,000, gave employment for a part of the year equivalent to 100,000 man-years, and distributed over \$60,000,000 in wages and salaries. In estimating the annual drain on our forest resources, certain converting factors have been used. Each of these factors represents in cubic feet the quantity of standing timber that must be cut in the forest to produce one unit of the material in question, based on the total cubic contents of the tree.

<sup>1</sup>See footnote to Table 2.

#### Subsection 2.—The Pulp and Paper Industry.

The manufacture of pulp and paper is a comparatively recent development in Canadian industry. Paper was first manufactured in Canada about a hundred years ago but prior to 1860 no wood-pulp was used or produced. Rags, straw, esparto grass, cotton waste, and other substances were the raw materials used. The first paper-mill was established at St. Andrews in Quebec (then Lower Canada) in 1803 by United States citizens who obtained concessions from the seigneurs. Upper Canada's first mill, which is still in operation, was built in 1813 at Crook's Hollow (now Greensville) near Hamilton, and the Maritime Provinces entered the industry in 1819 with a mill at Bedford Basin near Halifax.

In 1866, Alexander Buntin installed at Valleyfield, Que., what is claimed to have been the first wood-grinder in America and began the manufacture of wood-pulp by the mechanical process. During the same year Angus Logan and Co. built the first chemical wood-pulp mill in Canada at Windsor Mills in Quebec. During the next decade the use of wood-pulp in paper-making was extensively developed and in 1887 Charles Riordon installed the first sulphite mill in Canada at Merritton in the Niagara Peninsula; by the beginning of the century the output of the industry had exceeded \$8,000,000. In 1907 the Brompton Pulp and Paper Co. built, at East Angus in Quebec, the first mill in America to manufacture chemical pulp by the sulphate or kraft process.

The gross output of the industry increased rapidly and steadily until the boom years following the War of 1914-18, when it jumped to a peak of over \$232,000,000 in 1920. This was followed by a drop in 1921, after which there was a steady recovery, resulting in a second peak in 1929 of \$243,970,761. This was followed by annual decreases down to 1933 and annual increases up to 1937, with a decrease in 1938.

The rapid development of this industry up to 1929 was due chiefly to the existence in Canada of abundant water powers adjacent to extensive forest resources of pulpwood species and an increasing demand for newsprint paper in the United States. Summary statistics for the combined pulp and paper industry are given at pp. 272-281.

There are to-day three classes of mills in the industry. These, in 1938, numbered 27 mills making pulp only, 48 combined pulp and paper mills, and 24 mills making paper only.

The industry in Canada includes three forms of industrial activity, the operations in the woods with pulpwood as a product, the manufacture of pulp, and the manufacture of paper. These three stages cannot be treated as entirely distinct nor can they be separated from the different stages of the lumber industry. Some of the important pulp companies operate sawmills to utilize the larger timber on their limits to the best advantage, and many lumber manufacturers divert a proportion of their spruce and balsam logs to pulp-mills. So far as operations in the woods are concerned, it is often impossible to state whether the timber being cut will eventually be made into lumber or into pulpwood.

On account of legislation already referred to, pulpwood cut on Crown lands must, in every province, be manufactured into pulp in Canadian pulp-mills except under special permit. The pulpwood that is exported to the United States, therefore, is cut largely from private lands. Table 5 shows the annual production of this commodity from 1931 to 1938, together with the quantities used by Canadian pulp-mills and the quantities exported and imported.

In 1908 almost two-thirds of the pulpwood cut in Canada was exported in the raw or unmanufactured form, but by 1916 the proportion had declined to two-fifths, and is now even less.

### 5.—Production, Consumption, Exports, and Imports of Pulpwood, 1931-38.

NOTE.—Figures for earlier years will be found in the corresponding table of previous Year Books.

<sup>1</sup>Exports of pulpwood in the calendar year 1939 were 1,539,441 cords.

The manufacture of pulp is the second stage in this industry. This is carried on by mills producing pulp alone and also by paper manufacturers operating pulp-mills in conjunction with paper-mills to provide their own raw material. Such mills usually manufacture a surplus of pulp for sale in Canada or for export.

The supply of rags for paper-making is distinctly limited and the material too expensive for the manufacture of cheap paper. Early paper-makers experimented with fibres from the stems, leaves, and other parts of numerous annual plants, but the small proportion of paper-making material recoverable from such sources led to

experiments in the use of wood. Different species were tried, and finally spruce and balsam fir were found to be the most suitable for the production of all but the best classes of paper.

The preliminary preparation of pulpwood is frequently carried on at the pulp-mill, but there are in Canada a number of 'cutting-up' and 'rossing' mills operating on an independent basis, chiefly for the purpose of saving freight on material cut at a distance from the mill or on material intended for exportation. Pulpwood is measured by the cord (4' by 4' by 8' of piled material), which is approximately equivalent to 500 feet board measure or to 90 cubic feet of solid wood.

There are, in Canada, four methods of preparing wood-pulp, one of which is mechanical and three chemical. Detailed descriptions of these processes are given in the 1931 Year Book, pp. 290-291.

**Pulp Production.**—Growth was steady up to 1920, when 1,960,102 tons of pulp were produced. There was a drop in production in 1921, but production in 1922, at 2,150,251 tons, more than overtook the previous year's drop. Following this, with the exception of 1924, each year up to 1929 showed consistent growth in the annual production, 1929 creating a record for the industry with a production of 4,021,229 tons. This was followed by annual decreases down to 1932 since when steady increases were recorded, resulting, in 1937, in a new record of 5,141,504 tons, but production in 1938 fell off by almost 30 p.c.

#### 6.—Pulp Production, Mechanical and Chemical, 1931-38.

NOTE.—Figures for earlier years will be found in the corresponding table of previous Year Books.

Year.	Total Production. <sup>1</sup>		Mechanical Pulp. <sup>2</sup>		Chemical Fibre. <sup>2</sup>	
	Quantity.	Value.	Quantity.	Value.	Quantity.	Value.
	tons.	\$	tons.	\$	tons.	\$
1931.....	3,167,960	84,780,809	2,016,480	37,096,768	1,151,480	46,998,988
1932.....	2,663,248	64,412,453	1,696,021	28,018,451	967,227	35,987,294
1933.....	2,979,562	64,114,074	1,859,049	25,332,444	1,120,513	38,781,630
1934.....	3,636,335	75,726,958	2,394,765	30,875,323	1,241,570	44,851,635
1935.....	3,868,341	79,722,039	2,563,711	32,323,820	1,283,743	46,444,144
1936.....	4,485,445	92,336,953	2,984,282	38,674,492	1,480,925	52,701,156
1937.....	5,141,504	116,729,228	3,384,744	46,663,759	1,756,760	70,065,469
1938.....	3,667,789	87,897,148	2,520,738	39,707,479	1,147,051	48,189,669

<sup>1</sup>Some of these totals include unspecified pulp.

<sup>2</sup>Includes screenings.

During 1938 there were 27 mills manufacturing pulp only and 48 combined pulp and paper mills. These 75 establishments turned out 3,667,789 tons of pulp, valued at \$87,897,148, as compared with 5,141,504 tons of pulp, valued at \$116,729,228 in 1937. Of the 1938 total for pulp, 2,956,028 tons, valued at \$56,096,765, were made in the combined pulp and paper mills for their own use in manufacturing paper. Of the remainder, 142,696 tons, valued at \$5,896,616, were made for sale in Canada while 569,065 tons, valued at \$25,903,767 were made for export. As in the case of pulpwood, a part of the product at this stage of the industry provides raw material for the later stages, while the remainder has a definite market value as pulp.

Over 67 p.c. of the production in 1938 was groundwood pulp and almost 16 p.c. unbleached sulphite fibre, these two being the principal components of newsprint paper. Bleached sulphite, bleached and unbleached sulphate, soda fibre and groundwood and chemical screenings made up the remainder. A considerable market has developed for the latter in recent years in connection with the manufacture of rigid insulating boards.

7.—Production of Wood-Pulp in Canada, by Chief Producing Provinces, 1933-38.

NOTE.—Figures for earlier years will be found in the corresponding table of previous Year Books.

Year.	Quebec.		Ontario.		Canada. <sup>1</sup>	
	Quantity.	Value.	Quantity.	Value.	Quantity.	Value.

1938.....	1,858,971	44,220,224	1,057,984	25,821,023	3,667,789	87,897,148

<sup>1</sup>Includes production in British Columbia, Manitoba, New Brunswick, and Nova Scotia.

**Pulp Exportation.**—The following table gives the quantities of pulp exported by the principal pulp-producing countries of the world in 1938. Figures for 1913, the year immediately preceding the War of 1914-18, and for 1937 are shown for comparison. Figures of the exports of wood-pulp from Canada in the fiscal years ended Mar. 31, 1936-39, will be found in Table 12 of the chapter on External Trade. In the calendar year 1939 the exports of wood-pulp from Canada were 705,515 tons. The total exports of the ten principal pulp-exporting countries of the world in 1938 were 5,558,145 short tons, of which Canada contributed almost 10 p.c.

8.—Exports of Wood-Pulp from Principal Wood-Pulp Producing Countries of the World, 1913, 1937, and 1938.

**Paper Production.**—The paper-making stage of the industry involves the consumption of wood-pulp and other paper stock in the manufacture of paper and other pulp products.

During 1938 there were 48 combined pulp and paper mills and 24 mills making paper only. These 72 establishments produced 3,249,358 tons of paper, with a total value of \$151,650,065, as compared to 4,345,361 tons, valued at \$175,885,423 in 1937. Newsprint paper now forms 82 p.c. of the annual paper production in Canada. In 1938, the production was 2,668,913 tons, valued at \$107,051,202, a reduction of 27.4 p.c. in tonnage and 15.3 p.c. in value. The preliminary estimate for 1939 is 2,869,266 tons.

<sup>1</sup>A slight difference in classification accounts for the difference between these figures and those shown in Table 9.

**Exportation of Newsprint Paper.**—In the fiscal year 1908, exports of printing paper were recorded separately for the first time, and valued at \$2,833,535. In the fiscal year 1913, when quantities were first shown, Canada exported 146,792 short tons valued at \$5,692,126. For the fiscal year ended Mar. 31, 1939, exports of newsprint amounted to 2,475,399 tons valued at \$107,360,211 and ranked first among the exports of the Dominion. For exports of newsprint and other paper in the fiscal years ended Mar. 31, 1936-39, see Table 12 of the chapter on External Trade.

As early as 1913 Canada led the world with an exportation of 256,661 tons of newsprint. Her exports are now more than nine times that quantity. The following table shows the exportation of newsprint from the 12 principal exporting countries

in the calendar years 1913, 1936, 1937, and 1938. In 1938 Canada contributed to the total almost twice as much as the other 11 countries combined. Canada's exports of newsprint paper for the calendar year 1939 were 2,658,722 tons.

<sup>1</sup> Not available.

**Statistics of the Combined Pulp and Paper Industries.\***—The manufacture of pulp, the manufacture of paper, and the manufacture of products made of paper may, under certain conditions, be treated as three industries for they are frequently carried on in separate plants by entirely independent companies. For some time, however, it has been the practice of many Canadian concerns to combine the manufacture of pulp and paper in one complete establishment. In more recent years there has been a further tendency to combine in one plant the manufacture of basic stock and the converting of this paper into towels, stationery, and other highly processed paper products. In some cases, what might otherwise be considered as three distinct industries are carried on in one plant as three steps in the production of the finished paper article. This further converting of paper within the pulp and paper industry itself represents only a small part of Canada's production of converted paper and boards, the bulk of which is still made in special converting mills classified in other industrial groups.

The presence of these different combinations in one mill makes it difficult to separate many of the statistics relating to the manufacture of pulp, basic paper, and converted paper products. All converting operations carried on in paper mills in this industry are now attributed to the particular industrial group of converting plants to which they properly belong. The 1937 and 1938 figures, therefore, exclude all information pertaining to paper converting, which tends to lower perceptibly all the principal statistics of the pulp and paper industry and to render these figures not strictly comparable with those of previous years. Including manufacturing operations as far as the basic paper-making stage, there were altogether 99 mills in operation in 1938. The capital invested amounted to \$594,908,222, the employees numbered 30,943 and their salaries and wages amounted to \$42,619,311. If the pulp made for their own use in combined pulp and paper mills is disregarded the total of materials and supplies used in the industry as a whole can be considered as

\*See Chapter XIV—Manufactures—and Index for further particulars regarding the pulp and paper and paper-converting industry.

amounting to \$71,062,580 in 1938,\* \$91,121,629 in 1937,\* and \$72,202,983 in 1936; the gross value of production as \$183,897,503 in 1938,\* \$226,244,711 in 1937\* and \$185,144,603 in 1936; and net† value of production, \$89,034,186 in 1938,\* \$106,013,221 in 1937,\* and \$87,150,666 in 1936.

The pulp and paper industry, one of the leading single manufacturing industries in Canada, has been first in wages and salaries paid since 1922, when it first exceeded the sawmills. It was the leading industry in gross value of production from 1925, when it replaced the flour-mills, until 1935 when it was overtaken by non-ferrous smelting and refining. It has been first in net value of production and capital for some years. Only the manufacturing stages of the industry are considered in these comparisons, no allowance being made for capital invested, men employed, wages paid, or primary products sold in connection with the woods operations. These form an important part of the industry as a whole but cannot be separated from woods operations carried on in connection with sawmills and other industries. If the \$13,641,798 worth of exported pulpwood be taken into consideration, the gross total contribution of the pulp and paper industry toward Canada's excess of exports over imports in 1938 amounted to \$145,957,022, representing the difference between exports and imports of pulpwood, pulp, paper, and paper products.

The United States market absorbs annually over 99 p.c. of Canada's pulpwood exports, about 82 p.c. of her pulp, and 77 p.c. of her paper shipments. About half of the paper consumed in the United States is either of Canadian manufacture or is made from wood or wood-pulp imported from Canada.

### Subsection 3.—The Lumber Industry.

The manufacture of lumber, lath, shingles, and other products of the sawmill is the second most important industry in Canada depending on the forest for its raw materials. Annual statistics covering this and other forest industries were collected and published by the Forest Service of the former Department of the Interior from 1908 to 1916, since when the work has been carried on by the Dominion Bureau of Statistics, in co-operation with the Forest Service of the Department of Mines and Resources.

\*Owing to the adjustment in connection with combined paper mills and paper-converting mills, the 1937 and 1938 figures are not exactly comparable with those of previous years.

†Gross value of production less cost of power, fuel, and consumable supplies, as well as cost of materials.

### 13.—Quantities and Values of Lumber, Shingles, and Lath Produced in Canada, 1928-38.

NOTE.—Figures for the years 1908-27, inclusive, will be found at p. 300 of the 1931 Year Book.

1935.....	2,973,169	47,911,256	3,258,253	7,593,765	226,854	536,087
1936.....	3,412,151	61,965,540	3,019,030	6,754,788	286,323	874,231
1937.....	4,005,601	82,776,822	3,048,395	7,631,691	392,922	1,231,965
1938.....	3,768,551	72,633,418	2,761,978	6,894,654	229,467	656,230

The total number of sawmills, tie, shingle, lath, veneer, stave, heading and hoop mills, and mills for the cutting-up and barking or rossing of pulpwood reporting in 1938 was 3,873, as compared with 3,836 in 1937. The capital invested in these mills in 1938 was \$88,812,313, employment amounted to 31,182 man-years and wages and salaries amounted to \$25,345,064. The logs, bolts, and other materials and supplies of the industry were valued at \$53,591,378 and the gross value of production was \$92,855,906. The net production in 1938 was \$39,264,528.

The production of sawn lumber in Canada in 1920 reached a total of over four billion feet board measure, the highest cut recorded since 1912. Production in 1921 decreased by over a third and the average value by over \$10 a thousand feet. This was followed, with one exception, by annual increases up to 1929 and then by annual decreases down to 1932. There were increases in 1933, 1934, 1935, 1936, and 1937 and a decrease in 1938.

<sup>1</sup>Includes all other sawmill products.

British Columbia came first in total production, contributing 54.3 p.c. of the total cut in lumber and 82.2 p.c. of the shingles in 1938. Quebec followed in second place, Ontario was third, and New Brunswick fourth. Douglas fir is the most important kind of lumber sawn, and is produced almost entirely in British Columbia. Spruce is sawn in every province and comes second, with hemlock, white pine, cedar, and balsam fir next in order of importance. Cedar is the most important shingle-wood sawn. The conifers usually form about 95 p.c. of the total cut of all kinds of wood in this industry, only 5 p.c. being deciduous-leaved trees or hardwoods.

**Lumber Exportation.**—The square-timber trade reached its maximum development in the '60's; thereafter it declined gradually and has now almost entirely disappeared. Simultaneously with its decline came the increased exportation of deals and other sawn lumber, first to the United Kingdom and later to the United States. Trade with the latter country has been confined, from the first, largely to planks,

boards, and dimension stock. During the American Civil War exports of forest products of all kinds to the United States for the first time exceeded those to Great Britain, but in late years this has become the rule. The total quantity of sawn lumber and square timber exported from Canada changed little from 1900 to 1929, averaging about two billion ft. b.m. per annum, but decreased considerably in the next three years reaching its lowest level in 1932. Since that time lumber exports have recovered and in 1939 were 2,211,933 M ft. b.m. Of the 1939 exports, 53 p.c. went to the United Kingdom and 15 p.c. to other Empire countries, making 68 p.c. to the Empire as a whole. Twenty-eight per cent went to the United States and 4 p.c. to other foreign countries, making 32 p.c. to all foreign countries.

#### Subsection 4.—Manufactures of Wood and Paper.

Sawmills and pulp-mills draw their raw material directly from the forest in the form of logs and pulpwood, and produce sawn lumber, other sawmill products, and pulp and paper. There are also a number of important industries that use these products as raw material for further manufacture. Some of them produce commodities made almost entirely of wood, wood-pulp, or paper, others manufacture articles in which wood is the most important component, and others produce articles in which wood is necessary but forms only a small proportion of the value. There are, in addition, a number of industries that use wood indirectly in the manufacture of articles that do not contain wood as a component part. The first class includes the manufacture of paper, sash, doors, other millwork, and planing-mill products;

boxes, baskets, cooperage, and other containers; canoes, boats, and small vessels; kitchen, bakers' and dairy woodenware; wooden pumps, piping, tanks, and silos; spools, handles, dowels, and turnery. The second class includes the manufacture of furniture, vehicles and vehicle supplies, coffins and caskets, etc., and the use of paper in printing and the manufacture of paper boxes, bags, stationery, and paper goods. The third class, where wood has a secondary importance, includes the manufacture of agricultural implements, railway rolling-stock, musical instruments, brooms and brushes, etc. The fourth class can be said to include practically every form of industrial activity, as few, if any, of these are entirely independent of the use of wood, directly or indirectly.

A classification based on the chief component material in the products of each manufacturing establishment is now largely used in compiling manufacturing statistics and for external trade purposes. Under this system most of the forest industries fall in the wood and paper group. In 1938, this group, comprising 8,684 establishments gave 141,974 man-years of employment and paid out \$158,873,650 in salaries and wages. Capital invested in the industries of the group amounted to \$951,092,969, the gross value of its products was \$533,210,257 and the net value, \$277,002,267.

The forests of Canada contribute substantially to her export trade values. During the fiscal year ended Mar. 31, 1939, exports of wood and paper products amounted to \$214,488,484 and made up 23.1 p.c. of the total value of exports for the period, amounting to \$926,962,245. Domestic exports of wood and paper products were exceeded by those of agricultural (vegetable and animal) products, which made up 32.8 p.c. of the total, and by mineral products with 32.1 p.c. Wood and paper products are prominent among the individual items of export. Newsprint paper was first on the list in 1939, with planks and boards sixth and wood-pulp eighth. The gross contribution of wood and paper products toward a favourable trade balance for Canada amounted to \$182,546,620 during the same period.

#### **Subsection 5.—Forest Depletion and Increment.**

A detailed survey of depletion and increment appears at pp. 284-286 of the 1939 edition of the Year Book. This has been summarized at pp. 251-253 of Section 4 dealing with "Canadian Forest Resources: Their Relation to the War of 1914-18 and to the Present Effort" in this chapter.

# CHAPTER X.—FUR RESOURCES AND FUR PRODUCTION.

## CONSPECTUS.

	PAGE.		PAGE.
SECTION 1. THE FUR TRADE.....	277	SECTION 3. FUR PRODUCTION STATISTICS..	281
SECTION 2. FUR FARMING.....	278	SECTION 4. EXTERNAL TRADE IN FURS.....	283

### Section 1.—The Fur Trade.

**Historical Sketch.**—The place held by the fur trade during the French *régime* in Canada, when for a century and a half it was at once the mainspring of discovery and development and the curse of settled industry, is familiar history. Later, the Hudson's Bay Company may be said with truth to have held the West until the Dominion had grown to absorb it, bequeathing, to the civilization that followed, a native race accustomed to the white man and an example of organization and discipline that was of lasting value. The salient facts in the story are given in the Canada Year Book, 1934-35, pp. 343-344.

**Fur Resources.**—In the early years of the 19th century, the exports of furs from Canada exceeded in value those of any other product. Conditions have greatly changed, but the total output has not seriously declined and Canada may still be regarded as possessing, in her northern regions, one of the great fur preserves of the world. The rapid development of the country and the opening up of the West during the later 19th and earlier 20th centuries, together with improvements in transportation and settlement, meant the exhaustion of the fur resources of the settled parts. The trade, therefore, gradually retreated to less accessible territory. More recently the development of mining on a large scale over the Precambrian Shield has forced the trapper still farther north. Decline in fur resources has, however, been accompanied by increase in demand and higher prices, the encouragement of fur farming, and the introduction of conservation measures. Nevertheless, the belt of northern Canada, which includes the whole of the Northwest Territories, the northern parts of the Prairie Provinces, and extends through northern Ontario and Quebec and into the Maritimes, remains one of the few natural reservoirs for fine furs and the fur resource of this vast area constitutes one of its major assets to-day; in fact, minerals and furs will probably remain the chief resources since much of the area is unsuited to settlement or forest growth.

The fur bearers of Canada are mostly carnivorous animals, but two very valuable rodents are included, viz., beaver and muskrat. The largest fur-bearing animal is the bear—polar, along the Arctic Coast and Hudson Bay; grizzly, in the Rocky Mountains; and black, common in wooded areas generally. Wolves are common and widespread—grey, black, and blue are colour varieties of the same species. Fox pelts account for more than half of the fur trade. Fur farms now supply nearly all of the silver fox pelts, while the Arctic regions provide a great number of white skins and a few blue ones. The ermine, or weasel, is fairly plentiful throughout the Dominion and is found as far north as trappers are operating. Otter, beaver, marten, fisher, and mink are furs of exceptional quality and beauty and are secured throughout the whole of the timbered parts of the northern belt. The mink is now being raised extensively on fur farms and the pelt of the ranch-bred mink is regarded as superior to that of the mink taken in the wilds.

Among the rodents, the beaver has the most valuable fur, but this animal has begun to show signs of decreasing and restrictions on the taking of beaver have been made more rigid in consequence. Muskrat is now quite highly prized and, so far as number of pelts taken is concerned, is far in advance of any other species; under the trade name of "Hudson seal" its pelt has become a favourite moderate-priced fur.

**Conservation.**—At pp. 288-289 of the 1939 Year Book a short section appears dealing with conservation measures undertaken in regard to fur bearers.

## Section 2.—Fur Farming.\*

The fur trade is becoming more and more dependent upon the fur farms for its supplies of raw furs. In 1921 the value of pelts of ranch-bred animals accounted for only 3 p.c. of the total value of raw fur production, while in 1937 it had risen to approximately 40 p.c.

**Origin of the Fur-Farming Industry.**—A short account of the origin of the fur-farming industry in Canada is given at p. 249 of the 1929 edition of the Year Book, while a more detailed account of the earlier history of the industry is given in a publication of the Commission of Conservation, Ottawa, entitled "Fur Farming in Canada", by J. Walter Jones, B.A., B.S.A., the second edition of which was published in 1914.

**Fur Farms of Canada.**—The term 'fur farm' applies both to farms devoted entirely to the raising of fur-bearing animals and to parts of farms where the raising of fur-bearing animals is carried on as a branch of the operations. In addition to such farms, where animals are raised in rather confined quarters, many areas of marsh, stream, or lake are being operated as muskrat and beaver farms. In the case of these semi-aquatic animals, however, although the animals are usually kept within a carefully fenced area where they are given supplementary food and are protected from predatory enemies, they nevertheless live and breed under natural conditions.

Silver fox was the first important commercial fur bearer successfully raised in captivity, and it remains of greatest importance. The fur-farming industry, however, now includes other kinds of fur bearers—mink, fisher, marten, raccoon, and nutria. Mink farming, in particular, is showing rapid advancement throughout the Dominion, and is now second only to silver-fox farming. Considerable interest has been aroused by the announcement that the valuable chinchilla, a native of the Andes in South America, has been introduced into Canada. The first record is for the year 1937, when a farm in Saskatchewan reported the purchase of a pair. In 1938 a farm in Alberta also reported chinchillas. In California success has attended experiments in raising this fur bearer, and it is from that State the Canadian purchases were made. It is hoped that the Canadian climate will prove equally suitable for the raising of the chinchilla.

For many years the fox-farming industry was expanding so rapidly, both in Canada and abroad, that the chief source of income of ranches was the sale of live animals for breeding purposes, while the production of pelts was a minor or incidental feature. Thus, in 1925, the value of live silver foxes sold was \$2,755,000, while that of silver fox pelts was only \$736,000. As the number of foxes on fur farms progressively increased, ranchers had to readjust their economy to declining

\* Revised by Miss F. A. Brown, Chief of the Fisheries and Animal Products Branch, Dominion Bureau of Statistics. This Branch publishes detailed annual reports on fur farms and on the production of raw furs.

values for both live animals and pelts and the industry has gradually become stabilized on a pelt basis rather than on a live animal basis. In the latest year, 1937, the value of live silver foxes sold was only \$517,782 while that of silver fox pelts sold was \$5,019,487, and for all fur farms the sales of pelts represented 85 p.c. of the total revenue.

**Statistics of Fur Farms.**—The earliest Dominion-wide statistics of fur farms were collected for the year 1919. The statistics of 1919 recorded 429 fur farms with 8,326 fur-bearing animals.

**1.—Numbers of Fur Farms, Values of Land and Buildings, and Values of Fur-Bearing Animals, by Provinces, 1935-37.**

Province.	Fur Farms.			Values of Land and Buildings.			Values of Fur-Bearing Animals.

<b>Totals.....</b>	<b>7,495</b>	<b>8,142</b>	<b>9,179</b>	<b>6,590,825</b>	<b>7,097,036</b>	<b>7,687,171</b>	<b>9,381,825</b>	<b>9,838,280</b>	<b>9,676,431</b>

Table 2 indicates that the numbers of silver foxes and mink, the two fur-bearing animals that have proved most readily adaptable to domestication, were higher in 1937 than in any previous year. The values of animals on fur farms, on the other hand, have been greatly affected by the decline in prices since 1929.

<sup>1</sup> Based on estimates furnished by the operators of the farms.

<sup>2</sup> The publication of information concerning rabbits on farms has been discontinued.

The annual revenue of the fur farmer arises from two sources, the sale of animals and the sale of pelts. Table 4 shows the sales of animals by kinds in the years 1929 to 1937 and Table 5 the sales of pelts. During late years the sales of pelts have exceeded the sales of live animals, while in former years the reverse was the case.

<sup>1</sup> The publication of information concerning rabbits on farms has been discontinued.

**Preliminary Statistics for 1938.**—According to figures published at the time of going to press, fur farms numbered 10,455, lands and buildings were valued at \$7,930,842, and fur-bearing animals at \$8,929,754. Animals sold alive numbered 25,436, valued at \$730,074, while the 346,189 pelts sold were valued at \$5,752,742.

## Section 3.—Fur Production Statistics.\*

Early records of raw fur production were confined to the decennial censuses, when account was taken of the number and value of pelts obtained by trappers. In 1920 the Dominion Bureau of Statistics commenced an annual survey of raw fur production, basing its statistics on information supplied by the licensed fur traders. This survey was continued for some years. More recently, annual statements, based on royalties, export tax, etc., have been made available by the provincial game departments (except Prince Edward Island), and these statements are now used in the preparation of the statistics issued annually by the Bureau. In the case of Prince Edward Island, the statistics are based on returns supplied directly to the Bureau by the fur traders who deal in furs produced in the Province.

\* Revised by Miss F. A. Brown, Chief of the Fisheries and Animal Products Branch, Dominion Bureau of Statistics.

<sup>1</sup> Fur prices in this year were abnormally high. Any comparison of this figure with those of later years should take this into account.

The leading provinces with respect to value of raw fur production are Quebec, Ontario, and Prince Edward Island in the order named. The relation that the value for each province bore to the total for Canada in the year ended June 30, 1938, was: Quebec 16.0 p.c.; Ontario 15.0 p.c.; Prince Edward Island 12.9 p.c.; Northwest Territories 9.9 p.c.; New Brunswick 9.5 p.c.; Alberta 8.8 p.c.; Manitoba 7.5 p.c.; Saskatchewan 6.4 p.c.; British Columbia 6.2 p.c.; Nova Scotia 5.6 p.c.; and the Yukon Territory 2.2 p.c.

Lower average prices of furs are responsible chiefly for the decrease in total value. As will be seen from Table 8, average prices for all kinds, with the exception of cross, blue, and "other" fox and wolverine showed decreases from the prices for the preceding season. Silver fox, practically the whole pelt production of which is credited to the fur-farming industry, showed an increase in number, compared with the preceding year, of 45,511, but a decrease in value of \$594,122. The value of the silver fox pelts represented 47 p.c. of the total for all kinds of furs; second in importance was mink, with 11 p.c. Probably 40 p.c. of the number and 50 p.c. of the value of the total mink pelt production may be credited to the fur farms.

<sup>1</sup> Coyote or prairie wolf pelts for Manitoba are included with wolf pelts.

At the close of the War of 1914-18, Montreal took a position as an international fur market, holding the first Canadian fur auction sale in 1920. Through the medium of the Canadian fur auctions, grading and marketing of furs has been placed on a scientific footing, resulting in more or less stabilized conditional prices to the benefit equally of trapper, breeder, manufacturer, distributor, and consumer. At the sales held in Montreal during the year 1938, the pelts sold numbered 1,438,101 while the value amounted to \$4,992,956. Fur auction sales are held also at Winnipeg, Edmonton, and Vancouver.

During the past twenty years or so immense improvements have been made in the dressing, dyeing, and finishing of furs. In 1937, the 14 fur-dressing and -dyeing plants in Canada treated 4,004,620 fur skins, the chief kinds being rabbit (1,522,623) and muskrat (987,713). The number of plants engaged in the manufacture of coats, capes, scarves, muffs, etc., numbered 351 with a total output valued at \$16,261,100.

### Section 4.—External Trade in Furs.

The important external markets for Canadian furs are London and New York; the trade tables for the twelve months ended June 30, 1938, show that of the total of \$12,653,355 worth of raw furs exported, the United Kingdom took \$8,363,694 and the United States \$3,610,520. In 1667 exports of furs to France and the West Indies were valued at 550,000 francs. In 1850, the first year for which tables of the Customs Department are available, the value of raw furs exported was £19,395. The following table shows that the exports for recent years are greatly in excess of the earlier values.

<sup>1</sup> Not available.

Among living animals exported from Canada only two kinds of fur-bearing animals are separately classified by the Customs Department. These are foxes, separately recorded first in 1925, and mink, in 1931. Live foxes exported were valued at \$1,388,459 in the fiscal year ended Mar. 31, 1925, \$1,434,686 in 1926, when the highest value was recorded, and only \$47,348 in 1938. Live mink exported were valued at \$66,811 in 1931 and \$42,004 in 1938. Foxes have been separately classified among imports of living animals since the fiscal year ended Mar. 31, 1928, when those imported were valued at \$6,914 compared with \$6,666 in 1938.

# CHAPTER XI.—THE FISHERIES.

## CONSPECTUS.

	PAGE.		PAGE.
SECTION 1. THE EARLY FISHERIES.....	285	SECTION 3. THE GOVERNMENT AND THE FISHERIES.....	285
SECTION 2. THE CANADIAN FISHING GROUNDS.....	285	SECTION 4. THE MODERN FISHING INDUSTRY.....	288

### Section 1.—The Early Fisheries.

Fishing is among the earliest and most historic industries of Canada. Leaving aside inconclusive evidence in favour of authentic record, one must ascribe to John Cabot the honour of having discovered, in 1497, the cod banks of Newfoundland, when he first sighted the mainland of North America. Fishing may well be regarded as the first industry to be systematically prosecuted by Europeans in what is to-day the Canadian domain. It has since yielded a perennial harvest to both Europe and America. According to the Census of 1931, of 3,927,230 persons in Canada gainfully occupied in that year, 33,756 reported fishing as their principal occupation.\*

A more detailed account of the history of the Atlantic fisheries is given at p. 348 of the 1934-35 Year Book.

### Section 2.—The Canadian Fishing Grounds.

The fishing grounds of the Dominion are of exceptional national value inasmuch as two of the four great sea-fishing areas of the world border on Canada. They fall naturally into three divisions: Atlantic, inland, and Pacific fishing grounds. A detailed description of each division, of the fish caught, and of the methods of fishing, will be found at pp. 222-225 of the 1932 Year Book.

### Section 3.—The Government and the Fisheries.†

Upon the organization of the Dominion Government at Confederation, the administration of the Canadian fisheries was placed under the Department of Marine and Fisheries. Early in 1930 a Department of Fisheries, in charge of its own Minister, was organized. This Department now administers all the tidal fisheries (except those of the mainland portion of Quebec, which, by agreement, are under provincial administration), the non-tidal fisheries of Nova Scotia, and the fisheries of Yukon and the Northwest Territories. The non-tidal fisheries of New Brunswick, Prince Edward Island, Ontario, the Prairie Provinces, and British Columbia, and both the tidal and non-tidal fisheries of Quebec (except the fisheries of the Magdalen Islands) are administered by the respective provinces, although the Dominion Department does certain protective work in non-tidal waters of New Brunswick, Prince Edward Island, and British Columbia. The right of fisheries regulation for all the provinces, however, rests with the Dominion Government. (See the Fisheries Act, 22-23 Geo. V, c. 42). The expenditure of the Dominion on the fisheries in the fiscal year 1938-39, including civil government salaries, contingencies, etc., was \$2,568,443 and the revenue \$112,778.

\* See footnote 2 to Table 9, p. 295.

† Revised under the direction of J. J. Cowie, Acting Deputy Minister, Department of Fisheries.

**Conservation.**—River and lake fisheries certainly, and sea fisheries probably, if left to themselves, conform to the economic law of diminishing returns. The Canadian Government, accordingly, has had for a main object the prevention of depletion by the enforcement of close seasons, the forbidding of obstructions and pollutions, and the regulation of nets, gear, and fishing operations generally. In addition, an extensive system of fish culture has been organized: the Dominion, in 1938, operated 13 main hatcheries, 1 subsidiary hatchery, 6 rearing stations, 8 salmon retaining ponds, and several egg-collecting stations at a cost of \$233,408, and distributed 33,685,000 trout and salmon eggs, fry, and older fish. Distributions were made in suitable selected waters. Investigations and experiments directed toward the establishment of commercial oyster farming have been successfully carried on since 1929 in Prince Edward Island by the Dominion Department of Fisheries and have more recently been extended to Nova Scotia. In each of these provinces control of the oyster areas was transferred to Dominion authority by the Provincial Government. In the two other oyster-producing provinces, New Brunswick and British Columbia, control of the areas is in provincial hands, except on a small strip of the New Brunswick Coast where areas have been transferred by the Provincial Government to the control of the Dominion Department of Fisheries in order that certain investigations might be carried on.

**Direct Assistance.**—On the Atlantic Coast, where conditions attending fishing operations make such a service desirable, a system has been established of broadcasting radio reports as to weather probabilities, bait and ice supplies, and ice conditions. Systems of instruction in improved methods of fish handling, fish curing, etc., have been carried on for some years by the Department of Fisheries.

Continuing the plan that had been followed for several years in connection with direct aid to needy fishermen, the sum of \$500,000 was made available in the appropriations of the Department of Fisheries for the fiscal year 1938-39. In co-operation with the Governments of Nova Scotia, New Brunswick, Prince Edward Island, and Quebec, loans and grants were made during the year to 14,308 fishermen and 36 associations of fishermen. Joint aid funds were set up in each province by contributions from the Department and the Provincial Government, and from these funds assistance was given to fishermen in re-establishing themselves; total spendings from the departmental appropriation amounted to \$369,443.

Nation-wide advertising of fish foods was carried on by the Department of Fisheries during the year in order to assist the fishermen by expanding the demand for their product. Approximately \$150,000 was spent for this purpose during 1937-38. All of this amount was expended within Canada except \$15,000 which was transferred to the United Kingdom for use in supplementing the advertising of Canadian canned salmon and canned lobster in the "Canada Calling" campaign. In addition to the advertising in the Dominion, fish cookery lecturer-demonstrators were kept in the field by the Department as a further means of increasing the use of fish foods.

**Scientific Research.**—This subject is dealt with this year in the special article on Scientific and Industrial Research in Chapter XXV.

**International Problems.**—Fisheries problems of international importance have arisen from time to time on both coasts of the Dominion, as well as in the Great Lakes area where problems are complicated by the number of State governments concerned. A major international problem has been the question of United States

privileges in Atlantic fisheries of Canada. An outline of the history of this question may be found at pp. 351-352 of the 1934-35 Year Book. Since 1933, under the former *modus vivendi* plan, which grew out of the unratified treaty of 1888, United States fishing vessels have again been permitted to enter Canadian ports to buy bait and other fishing supplies.

Joint steps to deal with two important Pacific Coast fisheries problems have been taken in recent years by Canada and the United States: the preservation of the halibut fishery of the Northern Pacific Ocean and Bering Sea, and the protection, preservation, and extension of the sockeye salmon fisheries in the Fraser River system.

The first treaty relating to the halibut fishery was signed on Mar. 2, 1923. Under this treaty a close season for halibut fishing in each year was provided for and an international commission was set up to conduct an investigation into the fishery and the life history of the halibut. A further convention, signed at Ottawa on May 9, 1930, and ratified by the respective Governments on May 9, 1931, provided for the regulation of the fishery by the commission through the division of the convention waters into fishing areas, the changing of dates for close seasons, and so on. A new convention was signed at Ottawa on Jan. 29, 1937, extending the regulatory powers of the commission. Steps taken by the international commission under the several conventions have resulted in steady improvement in the state of the halibut fishery in the waters concerned.

The Sockeye Salmon Fisheries Convention was signed at Washington on May 26, 1930, but exchange of ratifications did not take place until July 28, 1937, although the Canadian Parliament had given approval to the treaty several years before that time. The convention waters include not only the Fraser River watershed in British Columbia but also certain Canadian, United States, and international waters making up the Fraser approach and through which the Fraser River sockeye pass.

Under the sockeye treaty the International Pacific Salmon Fisheries Commission was set up in 1937, consisting of three members appointed by Canada and a like number appointed by the United States. The Commission, which has established its headquarters at New Westminster, B.C., is empowered by the Convention to make "a thorough investigation into the natural history of the Fraser River sockeye salmon, into the hatchery methods, spawning ground conditions, and other related matters", to conduct the sockeye salmon fish cultural operations in treaty waters, and to make recommendations to the Governments on matters concerning "removing or overcoming obstructions to the ascent of sockeye salmon, that may now exist or may from time to time occur, in any of the waters covered by this convention...". Certain powers of regulation were also given the Commission by the Convention but one of the understandings on which the treaty was approved by the two countries was that "the commission shall not promulgate or enforce regulations until the scientific investigations provided for in the convention have been made covering two cycles of sockeye salmon runs, or eight years".

**Fishing Bounties.**—By an Act of 1882 (45 Vict., c. 18) for the development of the sea fisheries and the encouragement of boat-building, provision was made for the distribution, annually, among fishermen and the owners of fishing boats and vessels on the Atlantic waters, of \$150,000 in bounties, representing the interest on the amount of the Halifax Award. An Act of 1891 (54-55 Vict., c. 42) increased the amount to \$160,000, the details of the expenditure to be settled each year by Order

in Council. For the year 1938, payment was made under authority of the Deep Sea Fisheries Act (R.S.C. 1927, c. 74) on the following basis: to owners of vessels entitled to receive bounty, \$1 per registered ton, payment to the owner of any one vessel not to exceed \$80; to vessel fishermen entitled to receive bounty, \$6 each; to owners of boats measuring not less than 12 feet keel, \$1 per boat; and to boat fishermen entitled to receive bounty, \$5.55 each.

**Collection of Statistics.**—The fisheries statistics of Canada are issued under an arrangement for statistical co-operation between the Dominion Bureau of Statistics, the Dominion Department of Fisheries, and those branches of the different Provincial Governments having jurisdiction with regard to fisheries. Under this arrangement, the statistics of the catch and of the products marketed in the fresh state or domestically prepared are collected by the local fishery officers, checked in the Department of Fisheries, so far as operations in areas where the fisheries are under Dominion administration are concerned, and compiled in the Dominion Bureau of Statistics. In the case of manufactured fish products, schedules similar to those of other sections of the Census of Industry are sent by the Bureau to the operators of canneries, fish-curing establishments, etc. The fisheries officers assist in securing expeditious and correct reports.

### Section 4.—The Modern Fishing Industry.\*

The latter half of the nineteenth century saw the commencement of expansion in the commercial fishing industry of Canada. In 1844 the estimated value of the catch was only \$125,000. It doubled in the following decade and by 1860 had passed the million mark. Ten years later it reached \$6,000,000 and this was again more than doubled by 1878. By 1900 it had reached a total of \$21,000,000 and the growth continued with little interruption until 1918, when it reached the high record of \$60,000,000. Since then there have been decreases in value, due to lower prices rather than to smaller catches. In 1938 the value was \$40,492,976. It will be understood that the figures given represent the total value of fish as marketed, whether in a fresh, dried, canned, or otherwise prepared state.

\* Revised by Miss F. A. Brown, Chief of the Fisheries and Animal Products Branch, Dominion Bureau of Statistics. This Branch publishes an Annual Report on the Fisheries Statistics of Canada, together with advance summaries on fish caught, marketed, and prepared, by provinces.

VALUES OF THE FOUR PRINCIPAL SEA FISH  
1927-1938

QUANTITIES OF THE FOUR PRINCIPAL SEA FISH  
1927-1938

Among the different kinds of fish, the cod of the Atlantic and the salmon of the Pacific, in the earlier years of the fishing industry, were rivals for first place; since 1895 salmon has definitely taken the lead, and the heavy packs and high prices of lobster have, in more recent years, sent cod down to third place. For the salmon fishery the yearly average value of production in the period 1929 to 1938 was \$12,515,482; for the lobster fishery, \$4,567,646; and for the cod fishery \$3,319,603. For salmon the record year in the period was 1930, with \$17,731,891; and for the lobster and cod fisheries, 1929, with \$5,696,542 and \$5,394,636, respectively. In the early days of the industry the leadership among the provinces was with Nova Scotia, but British Columbia now occupies first place, Nova Scotia second, and New Brunswick third.

<sup>1</sup> Includes quahaugs.<sup>2</sup> Includes other items not specified.

**Quantities and Values in Recent Years.**—The values upon which the figures of Table 5 are based are those of the fish products as marketed, i.e., they include values added by processing such as the canning, curing, etc., of fish products. The indexes of volume, on the other hand, are based upon the quantities of fish reported as caught and landed.

### 5.—Percentages of Total Value and Indexes of Volume of Fisheries Production, by Principal Kinds of Sea and Inland Fish, 1927-38.

NOTE.—Based on values as marketed and quantities caught.

Kind of Fish.	1927.	1928.	1929.	1930.	1931.	1932.	1933.	1934.	1935.	1936.	1937.	1938.

<sup>1</sup> Landings at British Columbia ports by United States vessels excluded for 1934 and later years.

<sup>2</sup> Clams only in 1935 and later years.

<sup>3</sup> Totals include minor items not specified.

<sup>4</sup> Since ling cod was included with cod for 1926, the average of the years 1927-30 was taken as the quantity of ling cod for 1926 and this was deducted from the quantity of cod reported for 1926, the resulting amount being used as the base for the volume index.

**Establishments, Capital, and Employees.**—As indicated in Table 6, each of the provinces reported a reduction in the number of establishments operating in 1938. With regard to capital the total invested reached an all-time record of \$64,026,297 in 1930, declined successively for three years to \$40,914,057 in 1933, rose again in 1935 and in 1936, in 1937 declined slightly to \$44,926,764, and in 1938 advanced to \$48,561,442. The number of persons employed in the primary and secondary operations connected with the fishing industry declined from 80,450 in 1929 to 74,882 in 1931, rose steadily since then to 83,436 in 1934, dropped in 1935, to 82,918, rose again to 86,973 in 1936, declined in 1937 to 84,025, and increased to 85,894 in 1938. The 1938 figure is the second highest in the period 1920 to 1938.

**Trade.**—In view of the immense quantity of fish taken annually by Canadian fishermen, the trade must depend to a large extent upon the foreign market as an outlet for the product. From 60 to 70 p.c. of the yearly capture is an average export, of which the United States takes approximately one-half and the United Kingdom one-fourth. The most important single export is canned salmon (to the United Kingdom and European markets), followed by fresh lobster, canned lobster, fresh salmon, fresh whitefish, and dried cod (to the West Indies, South America, etc.). For fresh fish the United States is the chief market. A complete analysis of imports and exports, as well as of production, is given in the "Report on Fisheries Statistics, 1938," issued by the Dominion Bureau of Statistics.

## 12.—Values of Exports and Imports of Fish and Fish Products, Fiscal Years 1902-39.

NOTE.—In this table "Exports" includes seal oil and skins, fish oils, and whale oil, and "Imports" includes turtles, whalebone, shells and their products, fur skins of marine animals, fish, seal, and whale oils, and ambergris, in addition to fishery products as shown in Tables 12 and 13 of Chapter XVI on External Trade in this volume.

**Fisheries Production, 1939.**—Preliminary indications regarding the sea fisheries catch and landed value for 1939 would seem to show that there will be a slight drop in the catch of sea fish and shellfish and a slight falling off in the landed value. A small decrease in the marketed value is also indicated. On the Atlantic Coast there was a slight decrease in the quantity of lobsters taken and the dried fish production fell off considerably. On the Pacific Coast the catch of salmon was less and the pack of salmon showed a drop of almost 200,000 cases. The catch of halibut, however, was considerably greater. At the time of going to press (April, 1940) the statistics of the fisheries for inland Canada were not available.

**Historical Sketch.**—A short historical outline of the development of the mineral industry in Canada is given at pp. 309-310 of the 1939 Year Book.

**Statistics of Mines and Minerals.**—The compilation and publication of statistics concerning mines and minerals in the Dominion is carried out by the Mining, Metallurgical and Chemical Branch of the Dominion Bureau of Statistics, which works in close co-operation with the Mines Departments of the various Provincial Governments, collecting the data in collaboration with these Departments. Questionnaires sent to those engaged in mineral industries are designed to meet the requirements of both the Dominion and the Provincial authorities, thus eliminating duplication of labour.

More detailed information on the mineral production of Canada is given in the various reports issued by the Mining, Metallurgical and Chemical Branch of the Dominion Bureau of Statistics.\* The more important of these are: annual preliminary reports on the mineral production of Canada; a complete, detailed, annual report on the mineral industries; monthly bulletins on the production of the 16 leading minerals; and monthly, quarterly, and annual reports on coal statistics.

## The Development of Canada's Mineral Resources in Relation to the Present War Effort.†

### Introduction.

Stone, the single essential war mineral of the many millenniums of the Stone Age, was supplemented by copper and tin in the succeeding centuries of the Bronze Age. Wrought iron, laboriously worked from the small quantities of sponge iron produced from ore on the primitive hearth, probably became available for industrial and war use about 800 B.C. The introduction of gunpowder in the early fourteenth

\*The sections of this chapter, with the exception of Section 1, have been revised, as regards production figures, by W. H. Losee, B.Sc., Chief of the Mining, Metallurgical and Chemical Branch, Dominion Bureau of Statistics. A complete list of the publications of this Branch appears in Chapter XXIX, Section 1. Subsection 1 of Section 1 has been compiled from material supplied by the Lands, Parks and Forests Branch of the Department of Mines and Resources, Ottawa, and Subsection 2 of Section 1 from material furnished by the Provincial Governments.

† Prepared under the direction of Charles Camsell, C.M.G., LL.D., F.R.S.C., Deputy Minister, by E. S. Martindale, B.A. Sc., Division of Economics, Bureau of Mines, Department of Mines and Resources, Ottawa.

century—beginning a new epoch in warfare—added sulphur, saltpetre, and lead to the short list of essential war minerals. A couple of centuries later the newly developed charcoal-burning blast-furnace for the production of cast-iron was pressed into service to satisfy the rapidly increasing demand for larger and cheaper supplies of gun-making metals. Another two centuries were to elapse before coke was successfully substituted for charcoal in such blast-furnaces, adding coal to the muster roll of war minerals and lifting the restrictions on quantity production of cast-iron imposed by depleted forests.

The influence upon war armaments of the new industrial era that followed the invention of the steam-engine was little apparent until the middle of the nineteenth century, except in facilitating the production of the still relatively small requirements. Then, beginning with the substitution of iron for wood and of steam power for sail in warships, with the introduction of longer ranged rifled guns, and with the discovery of large-scale processes of making steel, virtually all the numerous new developments in mineral employment have been applied to military needs.

Just as transportation, communications, manufacturing, and other phases of civilian life have been completely revolutionized by these new developments and by the recent rapid progress in invention and in methods of mass production, so has the character of warfare been completely changed. As contrasted with warfare up to the beginning of the present century, modern warfare—as illustrated by the War of 1914-18 and, to a still greater degree, by the present War—demands the mobilization of the entire resources—economic (including mineral and industrial) as well as military—of the nations engaged.

**A Review of Present War Minerals.**—The War of 1914-18 established a record up to that time for its diversity of munitions and supplies, and for the tremendous requirements of such materials.

From the close interrelation that now exists between a nation's war operations and its industrial development, it is evident that practically all the many minerals used in the industrial arts are of war importance, directly or indirectly, and that no definite line can be drawn between minerals that are essential for war and those that are not. There are, however, several minerals, without ample supplies of which a nation, even though strong in man-power, cannot hope to defend itself successfully. These minerals are usually classed as *essential* war minerals, although they are in reality *indispensable* war minerals; they are not, however, limited to those from which armaments and munitions are actually made. Tungsten, for example, is used only in relatively small quantities, chiefly in making the high-speed tool steels necessary for high efficiency mass-production machining operations in munition factories, and is therefore listed as an essential war metal.

Iron still holds its long established position as the chief war metal, but it is no more essential than the manganese required in steel, and the nickel, chromium, cobalt, and molybdenum that, used in small proportions, give strength, toughness, hardness, resistance to shock, endurance, or other properties to the many steels used in war machines. Copper and zinc are essential for the making of brass cartridge-cases and other munitions: large quantities of zinc are used in galvanizing and in paints, and copper is widely used for electrical and communication equipment as well as for shell-bands. Lead and antimony are essential for the making of bullets for small arms and shrapnel, and lead for the storage batteries so widely used in war as in peace. Aluminium has become an essential metal, particularly for the building of aircraft, and magnesium is attaining importance for the same purpose. Platinum is valuable for electrical contact points and as a catalyser in

the production of sulphuric acid for the manufacture of explosives. Tin and mercury, are also essential, the latter being of special importance for the making of detonators for explosives.

Coal, though superseded by oil as naval fuel, is considered as the most important non-metallic war mineral. Petroleum—one of the recent war recruits—is, however, no less essential as the source of the liquid fuels that are vital to the movement of the naval, air, and highly mechanized land forces. Were it not for the lubricants produced from crude petroleum, present mechanized operations on land and sea and in the air would cease at once, and the supporting industrial machine could not function. Other non-metallic minerals usually classed as essential for war are sulphur, mica, asbestos, fluorspar, graphite, potash, magnesite, pyrite, phosphate, and iodine. There are many other minerals that, while actually as essential, are not so classed, in some cases because of widespread and abundant occurrence; limestone, essential for the smelting of iron ore and for the production of other war minerals, is an example. Such seemingly unimportant war-purpose minerals as those used in glass-making are other examples, although, without glass lenses and prisms for range finders, anti-aircraft artillery and long-range naval guns would lose most of their effectiveness.

No nation is self-sufficient in the possession of natural resources from which to draw its full requirements of raw materials, even in peace-time, and all are less so in meeting the greatly expanded war-time demands for essential raw materials. This is particularly true of mineral resources. Deficiencies in native supplies must, therefore, be made good by purchases from other nations—and in war time from allied or neutral nations only. Large economic resources are, therefore, of vital importance in the waging of modern major wars in order to finance such purchases. The great war significance of economic reserves has been demonstrated by the fact that, immediately on the outbreak of the present war, all the Allied nations, including Canada, set up exchange control organizations with wide powers to conserve and build up the national foreign-credit position. This emphasizes the importance of gold, the universally accepted medium of exchange, as an essential war metal, though not usually classed as such.

The contributions that can be made by a nation's mining industry to its war effort are thus of two kinds:—

1. The production at reasonable cost of those minerals that are essential for the manufacture of armaments, munitions, and other war supplies, as well as for normal civil needs.
2. The creation of essential foreign credits by the production of gold and silver, and of other minerals, surplus to national needs, for export sale to neutral countries.

### **Canada's Mineral Resources Development.**

The importance of mining in Canada's economy may be appreciated from the fact that it now ranks second among the great basic industries. The estimated output, valued at over \$473,000,000 in 1939, was the highest on record, yielding first place only to agriculture. The Dominion now occupies a leading position among world mineral producers—in 1938, ranking first in nickel, asbestos, and platinum; second in radium; third in gold, silver, copper and zinc; and fourth in lead. These important minerals are produced mainly for export. In addition, Canada produces large quantities of coal, gypsum, petroleum, and many other minerals.

The attainment of such prominence in the mineral field, a development largely of the present century, is evidence of the wealth of the Dominion's mineral resources.

It also shows ability to exploit these resources at the low costs necessary to increase export sales, particularly in the highly competitive export markets that have characterized the past decade. Moreover, all but a small portion of its present very substantial production of metals comes from ore deposits that have so far been found in two of its main physiographic divisions, the Canadian Shield and the Canadian Cordillera. Together, these comprise about two-thirds of the Dominion, but only relatively small portions have as yet been intensively prospected, and much has still to be geologically mapped. The various formations scattered over the vast extent of the Canadian Shield are remarkable for the useful minerals contained—copper, gold, iron, nickel, silver, platinum, cobalt, zinc, radium, chromium, graphite, mica, corundum, talc, feldspar, nepheline-syenite, and most of the other minerals that are used in the arts—the ore deposits ranging in extent to such major bodies as those now being worked at Sudbury, Noranda, Porcupine, Kirkland Lake, and Flin Flon. The Cordillera in British Columbia and Yukon is rich in lodes of gold, silver, lead, zinc, and copper, and has extensive deposits of coal and other minerals, sustaining the reputation of its southern continuation in the western United States, Mexico, and South America as a source of mineral wealth. In addition, the other three major physiographic divisions of Canada are rich in minerals. The Appalachian Highland of the Maritime Provinces, besides containing large deposits of bituminous coal, has yielded gypsum, salt, iron, gold, manganese, antimony, petroleum, and natural gas; and of southeastern Quebec, in addition to containing the world's largest known asbestos deposits, has yielded pyrite, chromite, copper, lead, zinc, and gold. The Great Interior Plain of Western Canada contains Canada's greatest reserves of the mineral fuels, coal, petroleum, natural gas, and bituminous sands, in addition to deposits of such industrial minerals as salt, gypsum, sodium sulphate, and refractory clays. Even the St. Lawrence Lowland, essentially an agricultural and manufacturing area, yields non-metallic minerals of great industrial value, including salt, gypsum, petroleum, and natural gas.

The foregoing brief statement of the diversity of the minerals found in Canada, together with the record of continued growth in mineral production in the past decade, indicates the very substantial contribution the mineral industries are in a position to make to the present war effort.

**Development of Canada's Mineral Resources for War Purposes.**—During the fifty-four years that intervened between Confederation and the War of 1914-18, Canada's attention was devoted almost entirely to the solution of the numerous problems related to the political and economic development of the new Dominion. Its mineral resources were accordingly explored and developed primarily on the basis of furnishing the growing mineral demands of such a peace-time program, modified by the fact that necessary supplies were conveniently available from the United States. They were also developed for the production of such minerals as could be sold in export markets to provide credits to finance imports of essential manufactured goods and supplies not yet produced in Canada.

In 1913, marking the close of the era of rapid western settlement and its accompanying railway expansion, the Canadian mining industry recorded its peak pre-War annual output value of \$145,635,000, of which metallic minerals represented 46 p.c., the mineral fuels 28 p.c., and the industrial minerals, including structural materials and clay products, 26 p.c. All but a relatively small portion of the metals were exported. Silver was the leading metallic mineral in output value, followed by gold, nickel, copper, lead, iron, cobalt, and zinc. Of the four non-ferrous base metals—copper, lead, zinc, and nickel—only lead was produced in refined form,

Canadian requirements of the others in refined form being imported. Of the non-metallic minerals then produced, coal, asbestos, and gypsum were the most important, the last two being very largely sold for export.

The development of Canada's mineral resources up to the commencement of the War of 1914-18, had, therefore, no relation to war requirements, except in the production of nickel matte for export, nickel then being considered largely as a war metal because of its important use in making armour plate. The significant development in the Dominion's mineral industry during the five years of the War was the establishment of domestic metal-refining facilities, the production of refined zinc and refined copper at Trail, B.C., commencing in 1916, and of refined nickel at Port Colborne, Ont., in 1918. Owing to the pressure of war demands at high prices, substantial increases in the production of nickel, copper, lead, zinc, pyrites, molybdenite, chromite, and asbestos were recorded in the war years. However, it was the large growth in mining operations of the period of prosperity ended in 1929, and, more particularly, in the six years of subnormal mineral prices (except for gold) that followed the low point of the depression in 1933, that has established the great strength of the Dominion's mineral position in support of the present war effort.

Not only is the Canadian mining industry able to produce very important essential war minerals in greater quantities than ever before, but it can do so profitably at prices very much lower than those that had to be paid during the War of 1914-18. Thus, a very valuable indirect contribution is being made to the conservation of the Allied economic reserves. In addition, by reason of the remarkable expansion in gold mining in recent years the industry is in an exceptionally strong position to add directly to those economic reserves.

CANADA'S MINERAL PRODUCTION IN 1918 UNDER THE MAXIMUM DEMAND OF THE GREAT WAR, AS COMPARED WITH PRODUCTION IN 1939, BY PRINCIPAL MINERALS.

<sup>1</sup> Subject to revision.

<sup>2</sup> Largely recovered at International Nickel Company's New Jersey refinery. This figure does not include the recovery in Great Britain from the Mond Nickel Company's nickel matte.

<sup>3</sup> Value of 689 fine oz. of platinum.

<sup>4</sup> Includes the value of platinum from placer deposits, but not that of platinum from nickel matte.

<sup>5</sup> Includes peat.

Canada's total annual mineral output value in 1939 (estimated at \$473,107,021) was 7.1 p.c. higher than in 1938; almost  $3\frac{1}{2}$  times that of 1913; and nearly  $2\frac{1}{2}$  times that of 1918, under the maximum pressure of war demand. Annual output value does not, however, provide an accurate basis by which to measure progress in mining development, because of the wide fluctuations in the prices of the several minerals over the period. In order to appreciate the contribution that the Canadian mineral industry can make to the present war effort, it is necessary to review its position with respect to each important war mineral produced, including those of primary importance in the building up of financial resources.

### Essential War Minerals Produced in Canada.

#### Metallic War Minerals—

In the first month of the present War, the large Canadian producers of copper, lead, and zinc entered into a one-year agreement (with the privilege of renewal) with the British Government to supply 210,000 short tons of refined copper, and the entire output of refined lead and zinc surplus to Canadian domestic requirements, at prices approximating the low prices then prevailing, with adjustments for shipping costs and for possible rises in production costs. A substantial portion of the British requirements was thereby assured at prices very much lower than were paid during the War of 1914-18. In any review of Canada's war effort this co-operation of the Canadian mining industry should receive due recognition.

**Copper.**—Copper is usually considered as the second most important of the war metals, more by reason of the large quantities required in application of the ordinary commercial uses to war needs than for its specific military uses. Canada has greatly strengthened its position as a copper producer since the close of the War of 1914-18. The annual production of 59,385 tons in 1918 under the pressure of war needs and high prices was more than doubled by 1929, and has shown an even greater increase in the period of depressed world prices that has since elapsed. The 1938 production of 285,625 tons represented 13.1 p.c. of world output, and ranked the Dominion as the third largest producer. Preliminary figures for 1939 show a further increase to 304,050 tons. Moreover, this large growth has been brought about chiefly by the discovery and development of new deposits across the Dominion. While the 1938 output from British Columbia, the largest source in 1918, was little reduced, the production from the deposits near Sudbury, Ont., the present largest source, was almost seven times that of 1918. Large quantities are obtained from new producers, including Noranda, Waite-Amulet, Normetal, and Aldermac, in Quebec; and Flin Flon and Sherritt Gordon in Saskatchewan and Manitoba. In addition to the strength derived from such broadening of sources of production, the Dominion is now equipped with two large copper refineries at Copper Cliff Ont., and at Montreal East, Que., with a combined rated annual capacity at present being increased to 245,000 tons of refined metal. While in 1918 the amount of copper refined in the original refinery at Trail (since closed) amounted to only 3,809 tons, or little more than 6 p.c. of the copper produced in that year, the production of refined metal in 1938 amounted to 227,240 tons, or to almost 80 p.c. of the year's total copper output.

The Canadian copper-mining industry is therefore in a position to make a major contribution to the copper needs of the overseas Allies in addition to taking care of domestic requirements. As already pointed out, shipments of the very substantial

quantity of 210,000 tons of refined metal—more than double the entire Canadian production in 1928—are to be made in the first year of its contract with the British Government. Furthermore, the industry, by its ability to sell this copper profitably at the pre-war price of slightly over 10 cents per pound, or nearly 16 cents less than the pegged price of 26 cents per pound paid by the Allies during the latter part of the War of 1914-18, is also making a very substantial contribution to the conservation of Allied financial resources.

**Lead.**—From its relatively unimportant position as a lead producer during 1914-18, Canada has advanced until it now ranks fourth among world sources of the metal. Its all-time peak production of 209,464 tons in 1938, almost ten times the average annual output of the four years of war demand from 1915 to 1918, comprised about one-ninth of the world production for the year. Moreover, there has been a substantial growth of 28 p.c. in the annual production in the period of low prices that has prevailed since 1929. This has come chiefly from the Sullivan mine in southern British Columbia. (The refinery at Trail has a rated annual capacity of 205,000 tons of refined lead.) In view of the fact that most of the output is sold in highly competitive export markets, largely in the United Kingdom, this record of increasing production for such sale indicates the relatively low producing costs in the Canadian lead industry.

Canada will therefore contribute large quantities of lead at low cost to the present war emergency. As in the case of copper, the economic benefits of this low-cost supply to the Allies may be appreciated by comparing the pre-war price of little more than 3 cents per pound\* of refined metal with the average price of nearly 8½ cents per pound received by Canadian producers during the last four years of the War of 1914-18.

**Zinc.**—Contrasted with the insignificant position of zinc in 1914, when the entire output comprised an estimated 3,623 tons contained in concentrates exported as such, the 1938 production of 190,753 tons—90 p.c. in refined form—ranked Canada as the third largest world producer. The annual production has almost doubled in the period of depressed prices since 1929, that of 197,267 tons (preliminary figures) in 1939 being a new all-time peak. About 75 p.c. of Canada's zinc comes from the Sullivan mine in southern British Columbia, probably the world's greatest zinc mine, and 20 p.c. from Flin Flon in Manitoba and Saskatchewan. Each mine has its own associated refinery. The rated annual capacities are 145,000 and 40,000 tons respectively, or a total of 185,000 tons of refined zinc.

Domestic requirements normally absorb only a relatively small portion of the production. As the production can be substantially increased, the Canadian zinc-mining industry can furnish large supplies for war purposes. Moreover, it can do so profitably at the pre-war price of about 3½ cents per pound for premium zinc which approximates the price that the principal producers have agreed to accept from the British Government. The war position of the Canadian zinc industry may be determined by comparing its 1939 production of 197,267 tons averaging 3·1 cents per pound in value, with its production in 1918 of 17,542 tons, the average value of which was 8·1 cents per pound.

\* This is reported to approximate the price that the chief producers have agreed to accept from the British Government in payment for their entire production surplus to domestic requirements.

**Nickel.**—Although used in much smaller quantities than copper, lead, and zinc, nickel is no less important as a war metal, both because of its strictly military uses such as in armour plate, gun forgings, gun recoil springs, and bullet jackets, and for its use in industrial nickel steels applied to military needs. Canada's extensive nickel-ore deposits near Sudbury are the present source of about 85 p.c. of the world's nickel, just as they were the principal source of nickel during the War of 1914-18. Production has, however, been greatly increased by reason of the increasing industrial uses of the metal, the peak peace-time production of 112,452 tons in 1937 being nearly  $2\frac{1}{2}$  times that of 1918 when Great War requirements were at their maximum. The outstanding development since 1918 has been the increased production of refined metal, the refinery at Port Colborne, Ont., which had an output of only 1,204 tons in 1918, now having an annual capacity of 75,000 tons of refined nickel. The output of refined metal in 1938 was 62,141 tons, or almost 60 p.c. of the year's total production of Canadian nickel.

The Canadian nickel producers are, therefore, in a position to provide ample supplies of nickel, both in refined and unrefined forms. Moreover, they can do so profitably at prices much below those that were paid during the War of 1914-18. This is indicated by the fact that the value of the 1939 production, estimated at 113,053 tons, largely refined metal, averaged  $22\frac{1}{2}$  cents per pound, compared with the corresponding average value of  $36\frac{2}{3}$  cents per pound for the entire output, almost wholly in unrefined form, for the four years from 1915 to 1918, inclusive.

**Iron.**—Iron-ore occurrences are numerous and widespread in the Dominion, and were the sources of the entire domestic consumption of pig-iron until 1895. However, with the availability to Ontario of the more cheaply produced and higher grade ores from the Minnesota iron ranges, and to Nova Scotia from the Wabana, Newfoundland, deposits, the production of Canadian iron ore declined until it ceased entirely in 1923.

The outstanding development in Canadian mining in 1939 was the resumption of production of iron ore in Ontario—at the New Helen mine in the Michipicoten district at the northeast corner of Lake Superior—under the encouragement of an Ontario Government iron bounty. The deposits contain an estimated 100,000,000 tons of siderite ore carrying about 36 p.c. iron. The ore is being beneficiated at the mine, the resulting sinter carrying about 53 p.c. iron. Shipments were commenced in the latter part of the year to the blast-furnace at Sault Ste. Marie, and are anticipated to be on the scale of about 300,000 tons annually.

Another significant development, in its bearing upon the reduction of the present Canadian dependence upon outside sources of iron ore, was the discovery in the winter of 1937-38 of large deposits of high-grade hematite ore, containing from 51 to 60 p.c. iron, at Steep Rock Lake, about 135 miles west of Port Arthur. Exploration and development have since been in progress. The present indications are that this is likely to prove one of Canada's most important mineral discoveries in recent years.

While of relatively small immediate importance in relation to the present war effort, these developments have a large potential significance in conserving Canada's exchange position by reducing foreign expenditures for the imported iron ores now used in Ontario's blast furnaces.

**Platinum Group Metals.**—The nickel-copper ores of Sudbury contain small quantities of the platinum group metals which collect in the sludge remaining from the

electrolytic refining of the nickel. Following the provision of facilities for the recovery and separation of these metals in England and later in Norway, Canada became the world's leading source of this group of metals.

Canada's production of platinum recorded an all-time high of 161,326 fine ounces in 1938. Refining is carried out for the most part in England, and the Allies are thus assured of a large part of the available world output. During the last four years of the War of 1914-18, the reported Canadian output averaged only 806 ounces\* per year, and was almost entirely refined in the United States.

**Cobalt.**—While not usually listed as an essential war metal, cobalt has important war applications. It is used as an alloy in the making of high-speed cutting steels, and for making valves for aeroplane engines.

At one time the world's leading producer of cobalt, chiefly as a by-product of the production of silver in northern Ontario, Canada now ranks third, its production in 1938 amounting in terms of metal content to 229.5 tons. This production can be increased, and ample refining facilities are available for the final treatment of both domestic and imported ores.

**Molybdenum.**—Molybdenum is used for alloying with steel to give toughness, and is thus valuable for war purposes. There was a substantial production of molybdenite, the principal ore, in Quebec during the years 1914-18, chiefly from a deposit at Quyon on the Ottawa River, but this ceased entirely in 1929 after a period of small and intermittent operation. The Quyon deposit is now (1940) being reopened. Several other deposits have been found across the Dominion, and the more promising are under development.

**Aluminium.**—Canada has no known commercial deposits of bauxite, the most important ore of aluminium but, because of abundant water-power resources, has become one of the world's most important producers of that essential war metal, ranking third in 1938. Production figures are not available for publication, but the quantities exported, comprising the great bulk of the output, give a fair indication of Canada's increasing importance as a producer of aluminium. Thus the exports of 64,724 tons in 1938, were 70 p.c. higher than in 1929, and almost 500 p.c. higher than in 1918.

The productive capacity of the Canadian aluminium-producing plants is at present being substantially increased; it has been announced recently (February) that the entire output, surplus to domestic requirements, is now under contract to the British Government.

#### **Non-Metallic War Minerals—**

**Coal.**—Though possessing an abundance of coal reserves, Canada has always drawn a large part of its requirements from foreign sources, the highly industrialized sections of central Canada being much more convenient to the nearby deposits south of the Lower Lakes than to the domestic mines. This dependence upon foreign coal supplies has been materially lessened since the War of 1914-18, and particularly in the latest ten years, with the granting of Dominion Government assistance to enable Canadian coal to meet the competition of such foreign coals in central Canada. In addition, there has been a large diversion in foreign sources of anthracite requirements from the United States to the United Kingdom, which is of special economic significance in the present war emergency.

\* See footnote 2 to the Statement on p. 302.

**Petroleum.**—The recent development of quantity production of crude petroleum in the Turner Valley field of Alberta has already materially reduced Canada's almost complete dependence upon foreign sources of supply of crudes. The Dominion's production, chiefly from Alberta, recorded an all-time peak of 7,838,310 barrels in 1939. Were it not for the restrictions on marketing of Turner Valley crude imposed by transportation costs and low prices of competing foreign crudes during the year the production would have been substantially greater. While this 1939 output was greater than the entire quantity of crude refined in Canada in 1918, it represented only 19 p.c. of the crudes so refined in 1938, and a smaller percentage of the total Canadian petroleum supply for the year, which included large quantities of imported refined products as well as crudes imported for refining.

**Asbestos.**—As the world's chief source of chrysotile asbestos, Canada can provide ample supplies from southeastern Quebec of this easily spun type of the mineral for essential war purposes, including brake-linings and high temperature insulation.

**Magnesite.**—Magnesite is important for use in refractory materials; and as a source of magnesium, now coming into use as a light-weight structural alloy. There is a large production of magnesian-dolomite for refractories in Quebec; and deposits of limestone containing brucite, another magnesium ore, have recently been discovered in Ontario and Quebec. Large magnesite deposits in southern British Columbia are also being developed.

**Mica.**—The Dominion's mica position is indicated by the fact that it has been a continuous producer of mica, almost wholly of phlogopite or amber mica, for over half a century, chiefly for export.

#### **Other Essential War Minerals—**

While occurrences of ores of such important essential war metals as antimony, tungsten, chromium, and mercury, as well as of other essential non-metallic minerals have been found in Canada, and these have in some cases been worked, domestic requirements have been obtained almost entirely from foreign sources. From the number of these occurrences there is reason to anticipate that careful prospecting will disclose important commercial deposits of many of these minerals. The production of high-grade electrolytic antimony from lead-silver smelter residues has recently commenced in British Columbia.

#### **Metals of Primary Significance in Strengthening the National Foreign-Credit Position.**

**Gold.**—In recent years, mining attention in Canada has been very largely concentrated upon gold. Annual production, mostly of lode gold obtained in increasing quantities from deposits found in the Canadian Shield, has, with few exceptions, risen each year since the close of the War of 1914-18. The preliminary figure of 5,095,176 fine ounces in 1939, is 7.8 p.c. higher than the previous all-time peak of the preceding year. Valued at \$184,144,756 in Canadian funds, the 1939 output represented immediately available foreign credits in the United States, at \$35 per fine ounce, of \$178,331,160. This is more than ten times the average annual foreign credits made available by Canadian gold mines for the four years from 1915 to 1918. Not only is the present gold contribution to the Dominion's economic strength so

much greater than during the War of 1914-18, but it is much more essential. For example, under the provisions of the present United States neutrality legislation, gold or its equivalent is indispensable in order that the fullest possible advantage can be taken of the huge industrial organization of the United States for the production of urgently needed war equipment.

**Silver.**—Although silver is, because of its present low price, produced in Canada chiefly as a by-product of the treatment of ores mined primarily for the production of lead, nickel, copper, zinc, gold, and radium, the Dominion ranks as the third largest world producer. The annual production in 1939, estimated at 23,116,861 fine ounces, was 4 p.c. higher than in 1938, and about 6 p.c. greater than the average output for the last two years of the War of 1914-18, but its value was less than half. Nevertheless, an annual contribution of \$9,359,553, as in 1939, is a substantial one towards the support of the national economic reserves.

### **The Great Strength of Canada's Mineral Industry in Support of the Present War Effort.**

It is evident from the above survey that Canada's mining structure, built up on the basis of peace-time needs, is capable of giving strong support to the present war effort. Particularly is this the case with the non-ferrous base metals, because of their vital importance in the military operations of modern mechanized war. Gold, however, is no less essential on the equally important economic front. In 1914-18, Canada was an important producer of nickel, although in unrefined form, but produced comparatively little copper, lead, and zinc, and of these only lead was produced in refined form. Its role as a world gold producer was then a small one. Since that time, however, its annual production of nickel has more than quadrupled; and the Dominion now holds a leading position, both as a producer and exporter, of copper, lead, and zinc, also of gold and platinum. It is fully equipped with huge metallurgical refining plants, one each for lead and nickel, and two each for copper and zinc, and all can be increased in capacity, as required, at relatively small capital outlay.

During the War of 1914-18 the world shortage of producing capacities of the essential base metals, and the urgency for larger supplies, forced prices to abnormally high levels. The large expansion in Canadian output together with the impressive dividend records of the producers during the past ten years of low prices can be accepted as evidence of the favourable mine-operating conditions that exist to-day in Canada. The Dominion's large producers of copper, lead, and zinc are passing the advantages of their low costs of production on to the British Government for war purposes, by agreeing to furnish the larger part of their outputs at virtually the prices that prevailed just prior to the War. On their purchases of these three metals under these agreements, the British Government will pay possibly from \$75,000,000 to \$90,000,000 less per year than for similar purchases in 1918.

The two recent events in Canadian mining noted at pp. 305 and 307, give additional strength to the industry's war position. The first relates to the discovery of high-grade hematite iron ore in western Ontario and the resumption, after 16 years, of the production of iron ore in Ontario at the New Helen mine. The second is the development of the Turner Valley crude petroleum field of Alberta. While of no immediate strategic importance, because of the unrestricted availability of ample supplies from conveniently situated United States reserves, they will increasingly strengthen the Dominion's financial position.

MAIN RAILWAYS THUS —

At the outbreak of hostilities in September 1939, the Dominion already occupied a strategic position as a major producer of highly essential war minerals. With its capabilities for increasing expansion under the pressure of war demand, the Canadian mining industry can be expected to play its full part in the present war effort, both in providing minerals essential for military and civil needs and for the support of the economic front.

## Section 1.—Mineral Lands Administration and Mining Laws.

The mineral lands of Canada, like other Crown lands, are administered by either the Dominion or the Provincial Governments. The Dominion Government administers the mineral lands of Yukon and the Northwest Territories as well as those in all Indian Reserves, and in National Parks; all other mineral lands lying within the boundaries of the several provinces are administered by the respective Provincial Governments.

### Subsection 1.—Mining Laws and Regulations on Dominion Lands.

Dominion lands to which these regulations apply are those administered by the Department of Mines and Resources, and lie within Yukon and the Northwest Territories. Titles issued for Dominion lands, the property of the Dominion Government, in the Territories of Canada reserve to the Crown the mines and minerals that may be found on or under such lands, together with the right of operation.

**Placer.**—Claims 500 feet long and from 1,000 to 2,000 feet wide, according to location, may be staked out and acquired by any person 18 years of age or over; claims to be marked by two legal posts, one at each end, and the line joining them marked. Creek claims are staked along the base line of the creek, and extend 1,000 feet on each side. River claims are 500 feet on one side of the river and extend back 1,000 feet. Other claims are staked parallel to the creek or river on which they front, 500 feet long by 1,000 feet. Expenditure in development of each claim to be incurred and proved each year, \$200 in Yukon and \$100 elsewhere. Royalty  $2\frac{1}{2}$  p.c. under the Yukon Placer Mining Act.

**Quartz.**—"Mineral" under this heading means all deposits of metals and other useful minerals other than placer deposits, peat, coal, petroleum, natural gas, bitumen, and oil shales.

Under the present regulations, effective Apr. 2, 1932, applicable to the Northwest Territories, any prospector or locator of a mineral claim, whether an individual, mining partnership, or a company, must hold a miners licence, the fee being \$5 for an individual, from \$5 to \$20 for mining partnerships, and larger amounts proportionate to their capitalization for mining companies. A licensee may stake out 6 claims on his own licence and 12 more for 2 other licensees, not exceeding 18 in all in any one licence year in any mining division. A mineral claim shall be rectangular and marked by a post at each corner—maximum area 51.65 acres, being 1,500 feet square. Entry is granted by a mining recorder, fee \$5 for a claim located by a licensee on his own licence and \$10 if located on behalf of another licensee. Grant is renewable from year to year, subject to representation work to the value of \$100 being done on the location each year, and the renewal of the owner's miners licence. A maximum of 36 claims may be grouped for purposes of representation work.

When prescribed representation work to the value of \$500 has been done and confirmed, discovery of mineral in place shown to have been made, a survey made by a Dominion land surveyor at grantee's expense, and certain other requirements met, a lease is issued for a term of 21 years, renewable, the rental for the full term of a claim not exceeding 51.65 acres being \$50. The cost of the survey, reckoned at \$100, may be counted as work done on the claim. When the profits of a mine exceed \$10,000 in any calendar year, there is a royalty of from 3 to 6 p.c. or higher, proportionate to profits. Miners licences are not required in Yukon under the Yukon Quartz Mining Act, but the general provisions of the Act are similar to those of the Quartz Mining Regulations above, except that the fee for a grant is \$10 and only 8 mineral claims may be grouped for operation.

In addition to these Quartz and Placer Mining Regulations, applicable to the Northwest Territories, and the Yukon Quartz and Placer Mining Acts, the following regulations regarding minerals are in force: *Yukon*—Dredging Regulations; Petroleum and Natural Gas Regulations. *Yukon and Northwest Territories*—Alkali Mining Regulations; Carbon-Black Regulations; Coal Mining Regulations; Potash Regulations and Domestic Coal Permits. *Northwest Territories*—Dredging Regulations; Oil and Gas Regulations; Quarrying Regulations and Permits to remove sand, stone, and gravel from beds of rivers.

### Subsection 2.—Provincial Mining Laws and Regulations.

The granting of land in any province except Ontario no longer carries with it mining rights upon or under such land. In Ontario mineral rights are expressly reserved if they are not to be included. Some early grants in New Brunswick and Quebec also included certain mineral rights. Otherwise mining rights must be separately obtained by lease or grant from the provincial authority administering the mining laws and regulations. Mining activities may be classified as placer, general minerals (usually metallic ores), fuel (coal, petroleum, gas), and quarrying. Under these divisions of the provincial mining industry, regulations may be summarized as follows:—

*Placer.*—In those provinces in which placer deposits occur there are regulations defining the size of placer holdings, the terms under which they may be acquired and held, and the royalties to be paid.

*General Minerals.*—These are sometimes described as quartz, lode minerals, or minerals in place. The most elaborate regulations apply in this division. In all provinces except Alberta, a prospectors or miners licence to search for mineral deposits, valid for a year, must be obtained. A claim of promising-looking ground of a specified size may then be staked. This claim must be recorded within a time limit, with the payment of recording fees. Work to a specified value per annum must be performed upon the claim for a period up to five years, when a grant or lease of the mining rights may be obtained subject to fees or annual rental. The taxation most frequently applied is a percentage of net profits of producing mines.

*Fuels.*—In those provinces in which coal occurs, the size of holdings is laid down and the conditions regarding work and rental under which they may be held. In some cases royalties are provided for. In the cases of petroleum and natural gas, a boring permit on likely ground is usually first obtained. If oil or gas is discovered, the operator may obtain the lease or grant of a limited area subject to rental or fees. A royalty on production is sometimes payable.

*Quarrying.*—Regulations under this heading define the size of holding and the terms of lease or grant.

The more important features of the regulations dealing with these divisions of the mining industry are outlined for each of the provinces below.

**Nova Scotia.**—*Administration.*—Minister of Mines, Parliament Buildings, Halifax. *Legislation.*—Mines Act (c. 22, R.S.N.S. 1923) and amending Acts of 1927 (c. 17), 1929 (c. 22), 1933 (c. 12), 1935 (c. 23), 1936 (c. 46), 1937 (c. 19), 1938 (c. 18), and 1939 (c. 22); Coal Mines Regulations Act (c. 1, 1927) and amending Acts of 1934 (c. 44 and 45), 1935 (c. 39), and 1938 (c. 37); and Metalliferous Mines and Quarries Regulations Act 1937 (c. 3).

*General Minerals.*—Prospectors licence at nominal fee. Lease of mining rights—40 years for gold and silver; 20 years, three times renewable, for other minerals; both subject to annual rental and performance of work.

*Coal.*—Royalty—12½ cents per long ton, with exemption of coal used in mining operations and for domestic purposes by workmen employed about the mine.

*Quarrying.*—Rights to limestone, gypsum, and building materials are acquired with ordinary land title.

**New Brunswick.**—*Administration.*—Department of Lands and Mines, Fredericton. *Legislation.*—Mining Act (c. 35, R.S.N.B. 1927), as amended by c. 27, 1927, and c. 23, 1933. In most grants of Crown land since about 1805, all mines and minerals are reserved to the Crown. Prior to that time, most of the land grants reserved only gold, silver, copper, lead, and coal.

*General Minerals.*—Prospectors licence, terminating Dec. 31, costs \$10. *Claims.*—A prospector may stake 10 claims of 40 acres each which must be registered within 30 days and 25 days' work done in each claim within the year. All this work may be concentrated on one of a group of claims. Mining rights are granted by mining licence, renewable annually, upon payment of \$10 per claim. When the mine produces on a commercial basis, a 20-year lease under similar conditions may be issued.

*Fuel.*—Royalties are 10 cents per long ton on coal and 5 p.c. on the value at the well's mouth for petroleum and natural gas.

**Quebec.**—*Administration.*—Minister of Mines, Quebec. Information and statistics on mining operations and geological explorations are to be found in the Annual Report of the Quebec Bureau of Mines. *Legislation.*—Quebec Mining Act (c. 80, R.S.Q. 1925) and amendments. In townships the Crown retains full mining rights on lands patented subsequently to July 24, 1880, and gold and silver rights on lands patented previous to that date. All mining rights belong to the Crown in most of the seigneuries.

*General Minerals.*—Miners certificate good for calendar year; fee \$10. *Claims.*—Five claims of 40 acres each must be recorded and 25 days' work per claim done within 12 months; a development licence renewable annually is granted upon payment of \$10 recording fee and 50 cents per acre. Mining rights can be purchased as a mining concession for \$5 per acre for superior minerals and \$3 per acre for inferior minerals. Operators must make annual returns to the Minister. Taxes are payable on annual profits at rates graduated from 4 p.c. upward.

**Ontario.**—*Administration.*—Department of Mines, Parliament Buildings, Toronto. A resident mining recorder is appointed for each mining division. *Legislation.*—Mining Act (c. 47, R.S.O. 1937) with amendments; applies to all

Crown lands except Indian lands. Title is a grant in fee simple, except in provincial forests where mining lands are leased. There is no apex law, all claim boundaries extending vertically downwards. Disputes are settled by the recorder, or on appeal, by the Judge of the Mining Court of Ontario.

*General Minerals.*—Annual miners licence—fee \$5 for an individual; \$100 on each \$1,000,000 capital for companies; holder permitted to stake 9 claims in any or every mining division for himself, but not more than 3 of such claims may be staked on behalf of any other licensee, nor may a total of more than 6 such claims be staked on behalf of other licensees. *Claims.*—In unsurveyed territory 20 chains square (40 acres) with lines N.-S. and E.-W. astronomically; in surveyed territory an eighth, a quarter, or a half lot, i.e., up to 50 acres. Representation work consists of the actual performance of at least 200 days' work within 5 years. *Taxation.*—Five cents per acre per annum on patented and leased mining lands with an area of 10 acres or over in unorganized territory; on net profits, with \$10,000 exempt, 3 p.c. up to \$1,000,000, 5 p.c. from \$1,000,000 to \$5,000,000, and 6 p.c. on the excess above \$5,000,000.

*Fuels.*—Petroleum, natural gas, coal, and salt on the James Bay slope may be searched for under authority of a boring permit. A total of 1,920 acres may be taken up by an individual in blocks of 640 acres. Certain areas have been withdrawn from staking.

**Manitoba.**—*Administration.*—Director, Mines Branch, Department of Mines and Natural Resources, Winnipeg; mining recorders' offices at Winnipeg and The Pas. *Legislation.*—The Mines Act (c. 27, 1930; c. 28, 1932; c. 25, 1933; c. 27, 1934; c. 26, 1937-38) and regulations thereunder; the Mining Tax Act (c. 27, 1933; c. 44, 1937); the Well Drilling Act (c. 50, 1937); the Crown Lands Act (c. 7 and 8, 1934; c. 9, 1935; and c. 12, 1938); the Manitoba Natural Resources Act (c. 30, 1930); and the Surveys Act (c. 190, C.A. 1924) and regulations thereunder.

*General Minerals.*—The regulations follow closely those summarized for Dominion lands in Subsection 1, except that: not more than 3 claims may be staked for any one licensee, and not more than 9 altogether by one person in any year in any mining division; representation work required is 25 days' work per year for 5 years, for which purpose 9 claims may be grouped.

*Fuels.*—A prospecting permit, good for one year, is necessary to search for oil, coal, gas, or salt. If mineral is discovered a 21-year lease, subject to annual rental and certain work, is granted.

*Quarrying.*—Lands up to 40 acres containing building stone, clay, gravel, gypsum, or sand may be leased as a quarrying location at an annual rental.

**Saskatchewan.**—*Administration.*—Department of Natural Resources, Regina. *Legislation.*—Mineral Resources Act of 1931 and regulations thereunder; Saskatchewan Mines Act, providing for the competency of mine managers and pit bosses, for the reporting of accidents, and the welfare and safety of those employed in the production of minerals; Coal Mining Industry Act, 1935, providing for a Coal Administrator to administer all legislation pertaining to the coal industry.

*General Minerals.*—The regulations follow closely those outlined for Dominion lands in Subsection 1, except that the holder of a miners licence may stake not more than 3 claims for himself and 3 for each of 2 other licensees; not more than 9 claims may be grouped for representation work.

*Coal.*—Three locations may be applied for by mail or in person; the size of a location may be from 80 acres to 640 acres, but the length must not exceed three times the breadth. All operators must be licensed by the Coal Administrator, the licence being contingent upon payment of fair wages, workmen's compensation assessments, rentals and royalties to the Crown, and certain other conditions. Operators must mine annually 5 tons per acre on leases issued since Jan. 1, 1936.

*Petroleum and Natural Gas.*—Locations may be applied for by mail or in person. The area of a location may be from 40 acres to 19,200 acres, and one person may apply for 3 locations, but not over 19,200 acres in all, except in unsurveyed lands, in which the limit is 1,920 acres. An operator must obtain a permit and furnish a substantial bond. All drillers must secure licences of competency. The record of a driller may be obtained by payment of a fee.

*Alberta.*—*Administration.*—Department of Lands and Mines, Edmonton. There is a staff of inspectors of mines. *Legislation.*—The Provincial Lands Act, 1939; the Oil and Gas Wells Act, 1931; the Oil and Gas Resources Conservation Act; the Mines Act; the Coal Sales Act; and the Coal Miners Wage Security Act.

The fuels—coal, natural gas, and petroleum—constitute the most important mineral resources of Alberta.

*Coal.*—All coal rights are disposed of under terminable leases at an annual rental of \$1 per acre and subject to a royalty of 5 cents per short ton on production. The minimum area is 40 acres and the maximum 2,560. New leases are granted only for the continuation of existing operations or in the few instances for purely local needs if the locality cannot be economically supplied by existing mines. The Chief Inspector of Mines with a staff of mine inspectors administers the regulations for the safe operation of all mines, sets examinations, approves and issues certificates of competency to operating officials, requires all companies to register their trade name and sell coal under their registered name, and also requires all coal operators to provide bond to insure payment of wages.

*Petroleum and Natural Gas.*—Areas of from 10,000 to 50,000 acres in a block may be placed under reservation for geological exploration for 45 days for a fee of 5 cents per acre. If monthly reports prove that the work is being diligently carried on, extensions up to a total of six months may be granted. Provided the work has been satisfactorily completed and all geological reports filed, leases may be applied for; a lease must first be obtained before a license to drill on Crown rights is granted. The applicant may be granted a credit to be applied on lease rentals of part of the approved expenditure in excess of 20 cents per acre.

Applications for leases must be made in person. The minimum area is 160 acres and the maximum 1,920. Leases are issued for a period of 21 years, renewable for a further 21 years, at a rental of \$1 an acre per year, and a royalty of 10 p.c. on the product of the location.

The drilling and production operations, and the production from oil and gas wells is controlled by the Petroleum and Natural Gas Conservation Board under very complete regulations based on sound engineering practice and waste prevention. Drilling sites must be approved. In producing oil fields the Board issues monthly orders giving the production allowable for each well, based on bottom hole pressure, gas-oil ratio, acreage, and rate of flow. The Board may levy a tax on petroleum property to cover administration costs.

**British Columbia.**—*Administration.*—Department of Mines, Victoria. The Department includes all Government offices in connection with the mining industry. *Legislation.*—The Department of Mines Act and other Acts respecting mining and minerals, notably: the Mineral Act (c. 181, R.S.B.C. 1936); the Placer-Mining Act (c. 184, R.S.B.C. 1936); Metalliferous Mines Regulation Act (c. 189, R.S.B.C. 1936); the Coal-Mines Regulation Act (c. 188, R.S.B.C. 1936); and amendments to the above Acts.

*Placer.*—Claims are of three classes: (1) creek diggings—250 feet long and 1,000 feet wide, 500 feet on each side of the stream; (2) bar diggings—250 feet square on a bar covered at high water, or a strip 250 feet long at high water, extending between high-water mark and extreme low-water mark; (3) dry diggings over which water never extends—250 feet square. A placer claim must be worked by the owner, or someone on his behalf continuously during working hours. Discontinuance for 7 days, except in close season, lay-over, leave of absence, sickness or other reason satisfactory to the Gold Commissioner, is deemed abandonment. To hold a placer claim more than one year, it must be recorded again before the expiration of the year.

Placer leases of unoccupied Crown lands, approximately 80 acres in extent, may be granted by the Gold Commissioner of the district, the annual rental for such a lease being \$30 and the annual expenditure required in development work \$250. Provision is also made for the granting of special leases of areas in excess of that referred to above.

*General Minerals.*—The terms of the mining laws are favourable to the prospector and operator, fees and rentals being small. Prospectors licence or “free miners certificate”—applicant must be over the age of 18; fee for individual \$5 per annum; for a joint-stock company \$50 or \$100 per annum depending on capitalization. Mineral claims must not exceed 1,500 feet square (51·65 acres); work, amounting to \$500, which may be spread over 5 years, required to obtain a Crown grant, while surface rights are obtainable at a figure in no case exceeding \$5 per acre.

## Section 2.—Summary of General Production.

The importance of mineral production as compared with other primary industries in Canada is indicated in Chapter VII, beginning at p. 167, while its part in the external trade of Canada is dealt with in Chapter XVI, especially Subsections 3 and 7.

### Subsection 1.—General Statistics of Mineral Production.

*Historical Statistics.*—Definite records of the annual value of mineral production go back only to 1886, as given in Table 1, although actual production began with the earliest settlements. The figures given are not strictly comparable throughout the whole period, minor changes having been adopted in methods of computing both the metallic content of ores sold and the valuations of the products. Earlier methods resulted in a somewhat higher value than those now in use would have shown. However, the changes do not interfere with the general usefulness of the figures in showing the broad trends of the mineral industry.

*Current Production.*—The trend in the development of the mineral resources of Canada is given at pp. 300-303 of the special article that appears at the beginning of this chapter.

**QUANTITY PRODUCTION OF THREE LEADING METALLIC  
AND  
THREE NON-METALLIC MINERALS**

• Subtotals in 1939-40 calculated from total values in these years on basis of price per unit in 1939

## 1.—Value of Mineral Production in Canada, 1886-1939.

Year.	Total Value.	Value per Capita.	Year.	Total Value.	Value per Capita.	Year.	Total Value.	Value per Capita.

<sup>1</sup>Contained in concentrates exported. <sup>2</sup>Not available. <sup>3</sup>Value in Canadian funds.  
<sup>4</sup>Not available for publication. <sup>5</sup>Included with petroleum refining. <sup>6</sup>Sulphur content of pyrites shipped and estimated sulphur contained in the sulphuric acid made from smelter gases.

**Analysis of Current Value and Volume.**—In order to interpret more clearly and simply the trends in mineral production in Canada over the period since 1929, Table 3 gives the percentage of the total value contributed by each principal mineral in each year. Values upon which percentages in this table are based are the annual values of mineral production expressed in Canadian currency as published.

**3.—Percentages of the Total Value of Mineral Production, by Groups, and Principal Minerals, 1929-38.**

Although the year 1926 was not a normal year in mineral production to the same extent as in some other productive fields, by using it as a base year the rapid changes that have resulted from circumstances arising since 1926 can be seen more clearly. Table 4 shows the indexes of volume of mineral production, using 1926 as the base year, by principal minerals, for the period 1927-38.

## 4.—Indexes of Volume of Mineral Production, by Principal Minerals, 1927-38.

## Subsection 2.—Provincial Distribution of Mineral Production.

Since 1907, Ontario has been the principal mineral-producing province of Canada, and, in recent years, has contributed about 50 p.c. of the total mineral production of the Dominion. The rise in the price of gold has been especially favourable to Ontario's mineral production, while the Sudbury nickel-copper deposits are another outstanding feature in the mineral resources of the Province. In 1938 Ontario's production was 49.7 p.c. of the total and in 1939, 49.0 p.c. For many years, British Columbia was firmly entrenched in second place in production, having most

of the important metals as well as substantial quantities of coal. However, since 1930, Quebec has been challenging British Columbia's position, having taken over second place on two occasions. Mineral production in Quebec has increased greatly since the opening up of the base and precious metal mines. Whereas formerly non-metallics (especially asbestos) and structural materials made up nearly all of its mineral production, more than half the value is now made up of metals, particularly gold and copper. Quebec's production in 1938 and 1939 was, respectively, 15.6 p.c. and 16.3 p.c. of the total, while British Columbia accounted for 14.6 p.c. in 1938 and 13.8 p.c. in 1939. Nova Scotia and Alberta are the most important coal-producing provinces. The discovery and development of the Flin Flon and Sherritt-Gordon orebodies resulted in the Provinces of Manitoba and Saskatchewan becoming important producers of base metals and gold and silver. Alberta, besides being a big producer of coal, produces considerable quantities of petroleum and natural gas, and, with the increased activity in this field, Alberta's share of total mineral production will probably increase.

### 5.—Mineral Production of Canada, by Provinces, 1920-39.

NOTE.—Figures for the years 1899-1910, inclusive, will be found at p. 345 of the 1933 Year Book, and for 1911-19, inclusive, at p. 323 of the 1939 edition.

<sup>1</sup>Includes production from the Northwest Territories.

<sup>2</sup>Figures for 1939 are subject to revision.

Table 6 shows the different minerals that make up the mineral production of each province and also the particular province or provinces that contribute to the production of each mineral in Canada.

## 6.—Detailed Mineral Production of Canada, by Provinces, 1938.

NOTE.—The mineral production of Yukon and the Northwest Territories during the calendar year 1938 was as follows, in quantities and values: copper 75,567 lb., \$7,535; gold 79,168 fine oz., \$2,784,734 (current price); lead 5,198,990 lb., \$173,854; silver 3,426,561 fine oz., \$1,489,765; coal 361 tons, \$3,400; petroleum 22,855 bbl., \$68,565; natural gas 1,500 M cu.ft., \$335; total, \$4,528,188. Radium and uranium salts were produced in Canada in 1938 from ores mined in the N.W.T., but statistics pertaining to those minerals are not available for publication. For Dominion totals by individual minerals, see Table 2. Dashes in this table indicate that there was no production reported.

### Section 3.—Industrial Statistics of Mines and Minerals— Capital, Labour, Wages, etc., in the Mineral Industries.

Annual statistical reports on the mineral production of Canada have been published for many years, first by the Geological Survey, later by the Mines Branch of the Department of Mines and, since 1921, by the Dominion Bureau of Statistics. Prior to that year the annual statistics of mines were confined chiefly to a presentation of the quantity production of each of the minerals and their value at average market prices for the year. The scope of the statistics now includes a general review of the principal mineral industries, such as the copper-gold, silver-lead-zinc, and nickel-copper industries, as well as a section on metallurgical works. The additional data include such features as capital employed, numbers of employees, wages and salaries paid, and net value of sales, while for 1934 and 1935 there was added a special survey of expenditures for equipment, supplies, freight, and insurance by the mining industry, and for 1937 a similar survey for the metal-mining and smelting industries only. The aim has been to extend the mining statistics beyond a summary of the production of individual minerals, by approaching the subject from the standpoint of industrial organization, definitely illustrating the place that mining holds in the scheme of Canadian productive enterprise.

A new figure "net income from sales" has been introduced since 1935 in accordance with a recommendation adopted by the Conference of Commonwealth Statisticians in Ottawa in 1935. The net income from sales is obtained by deducting the cost of fuel, electricity, and consumable supplies (explosives, lubricants, chemicals, etc.), consumed in the production process, from the net sales. In view of the fact that statistics of process supplies were not collected prior to 1935, it is impossible to present statistics of net income from sales for previous years comparable to this new figure.

The figures for net income from sales of industries given in Tables 7 and 8 are those reported by the operators, and are in each case the settlements received for shipments by producers and the additional values obtained when the smelting of ores is completed in Canada. The totals indicate more nearly the actual return to the different industries than do the values for the minerals in Table 2 of this chapter where, in the cases of copper, lead, zinc, and silver, the values are computed by applying the average prices for the year in the principal metal markets to the total production from mines and smelters with no reduction for fuel, electricity, and other supplies consumed in the production process. Some imported ores and concentrates are treated in Canadian non-ferrous smelting and refining works. The net sales of these plants include, therefore, the net value of the metals recovered from these imported ores and to this extent the net sales shown in Tables 7 and 8 include products not of Canadian origin.

#### Subsection 1.—Principal Factors in the Mineral Industries.

**Capital.**—In connection with the item of capital, operators are requested to report *only the capital actually invested in the enterprises*, including: (1) present value of lands, buildings, plant, machinery, and tools; (2) cost of materials on hand, supplies, finished products, and ore on dump; and (3) cash, trading and operating accounts, and bills receivable. It should be specially noted that no estimate of ore reserves is included in the capital. Capital expenditures in mining ventures are frequently very difficult to designate. For instance, purely exploratory work-

ings might properly be charged to current expenses, but if these exploratory workings open up new ore resources and become the channel by which such ore is utilized, such workings become part of the productive plant and as such their cost is an item of capital. On the other hand, after an orebody is exhausted, much of the mining plant has practically no resale value and, for this reason, many companies write off such capital value of their plant during profitable years of operation. In these circumstances, the actual amount of capital employed in mining enterprises is uncertain and the figures of capital given in Tables 7 and 8 should be used with such reservations in mind.

**Employees.**—Tables 7 and 8 also show the numbers of persons directly employed in the operating mineral industries. These figures, however, do not include those engaged in prospecting and exploration for individuals or small syndicates from whom no returns can be obtained, amounting probably in the aggregate to a considerable number. Neither do the figures include consulting geologists and mining engineers nor contract diamond drillers and their respective organizations.

**Commodities and Services Purchased.**—In addition to the expenditures for remuneration of those directly employed in the mineral industries, statistics are collected annually of expenditures for fuel and electricity, but the figures prior to 1935 given in Tables 7 and 8 are exclusive of the fuel and electricity used in metallurgical processes, such as reduction furnaces, electrolytic cells, etc. The mining industry expends annually large additional sums for the purchase of equipment, machinery, explosives, and a great variety of other supplies, and for freight and insurance. In special investigations made to obtain an estimate of these expenditures, firms engaged in all the mineral industries were circularized regarding such expenditures in 1934 and 1935 while, for 1937, a similar survey covered operators in the metal-mining and smelting industries only. For the earlier surveys returns received covered fairly completely the operating firms in the metal-mining and fuel industries, but in the other groups of mineral industries, where there are many small operators of gravel pits, small quarries, etc., the returns were much less complete. Furthermore, no attempt was made to reach prospectors and small development parties, though their aggregate expenditures, with the exploratory activity that exists at present, would amount to a large sum. The figures resulting from the surveys\* of 1934 and 1935 must, therefore, be regarded as suggestive rather than by any means comprehensive and the investigation for 1937 was confined to that portion of the mineral industry which could be most readily and completely covered. In 1935, the reported expenditures amounted to almost \$85,000,000. Of this, freight and express made up 14.7 p.c.; electric power, 12.6 p.c.; fuel and lubricants, 11.7 p.c.; timber and building materials, 7.8 p.c.; explosives, 6.5 p.c.; insurance, 6.0 p.c.; and the remaining 40 p.c. consisted of a great variety of purchases such as machinery and tools, railway equipment, electrical equipment, motor vehicles, rubber goods, chemicals, pipe, etc. The metal mines and smelters accounted for 77.7 p.c. of the expenditures and coal mines for 11.1 p.c. These expenditures for 1934 and 1935 are shown by commodity items, by industries, and by provinces at p. 356 of the 1937 Year Book. Expenditures during 1937 are shown by principal commodities in the statement at p. 329 of the 1939 Year Book. The comparable expenditures

\*The results of these surveys are given in the special reports of the "Consumption of Supplies by the Canadian Mining Industry" for 1934 and 1935, and in special bulletins on the consumption of supplies by the gold-mining and the base-metal mining, smelting, and refining industries in 1937, published by the Mining, Metallurgical and Chemical Branch of the Dominion Bureau of Statistics, and obtainable from the Dominion Statistician.

by the gold-mining industry in 1935 amounted to \$28,707,000 or 33.8 p.c. of the total, and by the base-metal mining and smelting industries to \$37,182,000 or 43.9 p.c. of the total reported expenditures by all the mineral industries in 1935. Therefore such expenditures by the gold mines in 1937 increased 41.5 p.c. and by the base-metal mines and smelters 59.5 p.c. as compared with 1935.

### Subsection 2.—Growth of the Mining Industry in Recent Years.

**Growth, 1922-29.**—From 1922 to 1929 the output of the mineral industries increased by 72 p.c., capital investment by 76 p.c., employment by 53 p.c., and salaries and wages by 65 p.c. Progress was most rapid in the metallic mineral industries, where the expansion in net production amounted to 170 p.c. with proportionate increases in capital and employment. The period from 1922 to 1929 was marked by a rising cycle of activity in construction. This was reflected in the expansion of industries engaged in the production of clay products and other structural materials. The output of this group of industries increased by 47 p.c. during the period, while, within the group, progress was much greater in industries producing cement, gravel, and stone than in the clay products industries. The group of non-metallic mineral industries remained relatively stationary in contrast to the other two main groups during this period of rapid expansion. This may be attributed to the fact that coal mining is the predominant industry in the non-metallic group and, under increasing competition from oil fuels and hydro-electric power, did not participate in the general industrial expansion of the period.

**Developments Since 1929.**—Following 1929 the mining industry was affected by the world-wide economic disturbances and by drastic declines in the prices of most of the principal metals, especially copper, lead, zinc, and silver. On the other hand, the price of gold has risen by about 69 p.c. since 1931. Under the influence of the early decline in base-metal prices, the value of the net production of the metallic mineral industries declined by 27 p.c. from 1929 to 1932, with a decline of 29 p.c. in employees and 30 p.c. in salaries and wages paid. But, since the higher price for gold stimulated its production and the readjustment of costs stabilized the base-metal industries, metal production has expanded again, and while the net sales in 1938 were not on a comparable basis with those of 1929, employees were 81.5 p.c. above, and salaries and wages 87.9 p.c. above 1929. While industrial statistics for 1939 are not yet available, the production figures for this latest year indicate that metal production was well maintained.

Among the non-metallic industries the demand for coal declined during the depression years owing to reduced requirements in industrial and transportation activities. Similarly, the demand for asbestos and gypsum was affected by the lower level of industrial and construction operations. Salt was an exception to the general rule, as its production was well maintained throughout, partly owing to its increased consumption in certain chemical industries. A large measure of recovery has taken place in this group of industries, especially in the production of non-metallic minerals other than fuels.

The production of clay products and other structural materials is directly dependent upon construction activities within Canada. During the early years of the depression these activities were partly maintained by governmental relief projects and by the carrying to completion of some large operations that had commenced before 1930. As a result construction reached its lowest level in Canada

during 1933, and the group of industries producing clay products and other structural materials was at a lower level of operation in that year than in any other year since 1921. From 1929 to 1933 there was a decline of 71 p.c. in net sales, 69 p.c. in employees, 74 p.c. in salaries and wages, and 76 p.c. in expenditures for fuel and electricity, a large item in the cost of production in these industries. However, construction has been more active in Canada since 1933 (see Chapter XV) and this increased activity has been accompanied by a welcome change to a rising trend in the production of clay products and other structural materials, although these industries are still at a low level compared with the period prior to 1929.

#### 7.—Principal Statistics of the Mineral Industries in Canada, by Groups, 1929-38, and by Provinces, 1938.

NOTE.—For the years 1921-28, see the 1936 Year Book, pp. 355-356. In the past, the net value of production, called "net sales", in these industries has been gross sales less freight and treatment charges in the case of mines, and less the value of ores charged in the case of smelters. According to a recommendation adopted by the Conference of Commonwealth Statisticians in Ottawa, 1935, the net figure, called the "net income from sales", is now obtained from net sales as defined above by a further deduction of the costs of fuel, electricity, and consumable supplies used in the production process. In the table below, however, to facilitate comparison with previous years, figures for 1935 are given to show deductions and resultant net by both methods, and figures since then on the new basis only.

<sup>1</sup>Exclusive of fuel and electricity used in metallurgical processes, except for the footnoted figures for 1935, 1936, 1937, and 1938, which include all fuel and electricity (whether for metallurgical processes or not) and also the cost of consumable supplies.

<sup>2</sup>See headnote.

<sup>3</sup>This is "net income from sales"; see headnote.

<sup>4</sup>Includes cost of freight and treatment charges reported for the first time in 1937. They were formerly deducted by the shipper of metal-bearing ores in reporting the value of such ores shipped.

**Subsection 3.—Principal Mineral Industries.**

A summary of the industrial statistics of the principal mineral industries operating in Canada in 1937 and 1938 is presented in Table 8. Gold mining had in 1938 the largest labour force, having exceeded coal mining for the second year in succession. Employment in the gold industry is much less subject to seasonal fluctuations and expenditures on salaries and wages are considerably greater than those of the coal-mining industry. The smelting and refining industry was third in the number of employees and in salaries and wages paid.

## 8.—Principal Statistics of the Mineral Industries of Canada, by Industries, 1937 and 1938.

NOTE.—See headnote to Table 7, p. 327.

<sup>1</sup>See headnote to Table 7, p. 327.<sup>2</sup>Includes freight and treatment charges. (See footnote 4, Table 7, p. 328.)<sup>3</sup>Includes natural abrasives; also a small production of peat, normally included in fuels.

### Section 4.—Production of Metallic Minerals.

The metals of chief importance in Canada are cobalt, copper, gold, iron, lead, nickel, those of the platinum group, radium, silver, and zinc. These are dealt with in separate subsections in alphabetical order. In addition, there are a number of others produced in minor quantities, principally as by-products in the treatment of metalliferous ores, and their production during the three latest years is shown in Table 2, while their production by provinces in 1938 appears in Table 6.

## Subsection 1.—Cobalt.

For almost two decades prior to 1925, the major portion of the world supply of cobalt was derived from the orebodies of the Cobalt district, which were discovered in 1903, and carry silver, cobalt, nickel, bismuth, and arsenic. Large deposits of cobalt-bearing ores occur in Africa in the Belgian Congo, Northern Rhodesia, and French Morocco, and the introduction into world markets of cobalt from these sources has increased world production while Canadian production has declined since 1925.

## 9.—Production of Cobalt in Canada, 1920-39.

NOTE.—Figures for the years 1904 to 1919, inclusive, will be found at p. 334 of the 1939 Year Book.

## Subsection 2.—Copper.

The earliest important copper-mining district in Canada was in the Eastern Townships of Quebec. Operations ceased in this part of Canada during mid-summer 1939. Production from the Sudbury district became important about 1889, and from the mines of British Columbia about 1896. From 1898 to 1929 British Columbia was the leading copper-producing province. Production came from the Rossland and Boundary districts, the Copper Mountain mine, and the Britannia and Hidden Creek mines along the coast. Shortly after the War of 1914-18, large development programs were carried out in connection with the Noranda and other copper-producing properties of western Quebec, with the Flin Flon and Sherritt-Gordon properties in western Manitoba, and a very large expansion program at the nickel-copper properties of Sudbury. The effect of these developments has been the tremendous increase since 1927 in the production of copper and nickel as well as associated metals such as platinum, palladium, selenium, and tellurium. Modern and efficient mining methods and plants, and the presence in the ores of small but appreciable quantities of precious metals have made possible the profitable production of copper even under the relatively low prices prevailing since 1930.

# 10.—Quantities of Copper Produced in Canada, by Provinces, with Total Values, 1920-39.

NOTE.—Figures for the years 1886 to 1910, inclusive, will be found at p. 272 of the 1916-17 Year Book and for 1911 to 1919 at p. 335 of the 1939 edition.

### Subsection 3.—Gold.

Canada has been a gold-producing country for over 75 years. During the last half of the 19th century production was chiefly from placer operations in British Columbia and Yukon, while during the present century there has been a rapid growth of production from lode mining both of auriferous quartz and of gold in association with other metals. Gold production in Canada attained its earlier maximum at 1,350,057 fine oz., in 1900, when the Yukon production reached its highest point. The quantities and values of gold produced in Canada are given by provinces for 1920 and subsequent years in Tables 12 and 13. The official estimate for 1939 is 5,095,176 fine oz.

Producers of gold have benefited in recent years not only from the general decline in the prices of other commodities, with a consequent reduction in their operating costs, but also from the rise in the world price of gold itself. Under the stimulus of higher prices, prospecting for gold has been more active during recent years than ever before.

Gold is produced in Nova Scotia, at points across the Canadian Shield from Quebec to the Northwest Territories, and in the Cordilleran Region of British Columbia and Yukon. Except for comparatively small amounts obtained from alluvial workings in Yukon, British Columbia, and Alberta, the production is derived from lode mining either of auriferous quartz or of other metallic ores such as copper, nickel, and zinc that carry varying amounts of gold. The principal producing districts are: western Quebec; the adjacent districts of Porcupine and Kirkland Lake in Ontario, with other smaller camps scattered across northern Ontario to the western boundary; the Rice Lake and Gods Lake areas in eastern Manitoba and the Flinflon district on the Manitoba-Saskatchewan boundary; the Bridge River district and the new camp at Zeballos on the west coast of Vancouver Island in British Columbia. Developments in the Yellowknife district in the Northwest Territories have resulted in three producing mines. A property near Lake Athabasca in Saskatchewan was brought into production in 1939 after a period of extensive development. With new areas of promise being discovered, and with the reserves in older camps being extended and operations expanded, there is every prospect for the continued increase of gold mining in Canada. At the present time the leading gold producer in Canada is the Hoffinger mine in the Porcupine camp, the second is the Lake Shore mine in the Kirkland Lake camp, and the third is Noranda, a copper-gold mine in western Quebec. In 1939 about 83·3 p.c. of the total production came from auriferous quartz mines; about 14·2 p.c. from mines in which gold was associated with ores of copper, nickel, zinc, etc.; and about 2·5 p.c. from alluvial operations. The number of producing auriferous quartz mines increased from 37 in 1930 to 226 in 1938.

## 12.—Quantities of Gold Produced in Canada, by Provinces, 1920-39.

NOTE.—Figures for the years 1862 to 1910, inclusive, will be found at pp. 268-269 of the 1916-17 Year Book, and for the years 1911 to 1919 at p. 336 of the 1939 edition.

<sup>1</sup> From 1920 to 1931, inclusive, values calculated on basis 1 fine oz. = \$20.671834; since then, at world prices in Canadian funds. <sup>2</sup> First reported production in this province. <sup>3</sup> Includes value of production of the Northwest Territories amounting to \$7,038 in 1935; \$35 in 1936; \$239,190 in 1938; and \$1,821,615 in 1939. <sup>4</sup> Preliminary figures.

**World Production.**—The development of the gold-mining industry of the world since the discovery of America may be sketched in four successive periods. During the first period extending from 1493 to 1760, the annual production averaged

nearly 337,000 fine oz. The placer mining of Brazil and Colombia swelled the average output of the last 60 years of the period to about 606,000 fine oz. per year.

The production of Russia from placer mining was a considerable factor in the next period, extending from 1761 to 1840, that country retaining first rank among the world producers until 1837. The average annual production during the period was 565,500 fine oz.

The third period, extending from 1841 to 1890, was notable for the remarkable discoveries of gold in California and Australia in 1848 and 1851, respectively. The annual average during the 50 years was 4,937,000 fine oz. For the first decade the average was 1,761,000 fine oz. and for the second 6,448,000, while in the last decade it declined to 5,201,000. The production of the period was contributed chiefly by the United States, Australia, and Russia.

In the fourth period, extending from 1891 to the present time, covered by the figures of Table 14, the outstanding features were the entry of South Africa as an important and later as the leading producer, the increase in the output of most of the gold-producing countries through the introduction of the cyanide process and, more recently, the rapidly increasing world production as a result of the appreciation in the value of gold. The output was 6,320,000 fine oz. in 1891 and a steady increase was recorded until 1915, when 22,847,000 fine oz. were produced. Thereafter, the great increase in wages and in the other costs of production of an article of fixed value brought about a steady decline to a minimum production of 15,497,000 fine oz. in 1922. However, the notable decline in general commodity price levels that occurred in 1921 and 1922 again reduced the costs of gold production and the industry responded with a distinctly upward trend thereafter throughout the 1920's. The increased price of gold since 1930 has accelerated the expansion in world production during recent years and all previous records have been exceeded.

<sup>1</sup> At \$20·67+ per oz. fine prior to 1934; at \$35 per oz. fine in 1934 and later years.

<sup>2</sup> Preliminary figures.

In 1938 the world's chief producers were the Union of South Africa, with 32·3 p.c., U.S.S.R. (Russia), including Siberia, with 13·9 p.c., United States with 11·3 p.c. and Canada with 12·5 p.c. As Australia, Rhodesia, British West Africa, and British India were also important producers, over 55 p.c. of the world production of 1938 was produced in the British Empire.

## Subsection 4.—Iron.\*

Iron ore is widely distributed in Canada and extensive deposits have been discovered from time to time, but none at present available can compete in low cost with high-grade external sources of supply.

Bog iron ore was first mined and smelted in the Province of Quebec early in the eighteenth century, and from that time until 1883 the industry was carried on almost continuously at Three Rivers. Other furnaces using local ore were operated at Radnor Forges and Drummondville, the last to shut down being the Drummondville furnace in 1911.

The large iron and steel industry of Nova Scotia draws its requirements of iron ore from the easily accessible and abundant supplies of the high-grade Wabana deposit in Newfoundland. In Ontario, also, there has been a broad development of the primary iron and steel industry largely because cheap and high-grade supplies of iron ore are readily available from the Mesabi Range of Minnesota, while coal supplies are drawn from the nearby coalfields of Pennsylvania.

## 16.—Iron-Ore Shipments and Production of Pig-Iron, Ferro-Alloys, and Steel Ingots and Castings, 1920-39.

NOTE.—Figures for the years 1886 to 1910, inclusive, will be found at p. 373 of the 1936 Year Book and for the years 1911 to 1919 at p. 340 of the 1939 edition.

<sup>1</sup> Although shipments of ore are expressed in short tons, the trade uses long tons as the quantity unit for pig-iron, etc.      <sup>2</sup> Preliminary figures.

During the summer of 1937, the Algoma Properties, Ltd., commenced rebuilding the surface equipment at the new Helen mine in the Michipicoten district, where reserves are estimated at 60,000,000 tons of iron carbonate rather high in sulphur and therefore requiring roasting to fit it for use in the blast furnace. As a result of an Act passed by the Ontario Legislature, which provides for a bounty of two cents per unit of iron content for a period of 10 years commencing Jan. 1, 1939, Canada was able to report, for the first time since 1923, a production of iron ore in 1939. In addition, development work was carried on at Steep Rock Lake near Atikokan,

\* The known resources of iron ore are described briefly at p. 411 of the 1934-35 Year Book, and a sketch of the iron and steel industry of Canada is given on pp. 452-456 of the 1922-23 Year Book.

135 miles west of Port Arthur, for the production of high-grade iron ore. Magnetic surveys and diamond drilling through the ice have proved the existence of a large body of high-grade ore. A shaft is now being sunk on the property and, if preliminary indications are a guide, this is one of the most important and far-reaching mineral discoveries in Canada for some time.

### Subsection 5.—Lead.

Lead is obtained in Canada largely from the ores of British Columbia, where production began with 88,665 lb. in 1891. Bounties were paid on lead produced in Canada from 1899 to 1918 (see the 1920 Year Book, p. 454) but the highest production of this period was 56,900,000 lb. in 1905. However, as a result of developments in British Columbia mentioned below, production has increased greatly since the War of 1914-18. The data in Table 17 represent the quantities of lead produced in Canada from domestic ores, together with estimated recovery from lead ores and concentrates exported.

### 17.—Quantities and Values of Lead Produced from Canadian Ores, 1920-39.

NOTE.—Figures for the years 1887 to 1910, inclusive, will be found at p. 367 of the 1929 Year Book and for the years 1911 to 1919 at p. 341 of the 1939 edition.

<sup>1</sup> From 1920 to 1925, average prices at Montreal; from 1926 to 1939, average yearly prices at London, England.

<sup>2</sup> Preliminary figures.

**British Columbia.**—In the East and West Kootenay districts there are many important mines, the principal of which is the Sullivan lead-zinc mine near Kimberley. The ore averages about 11 p.c. lead, 7 p.c. zinc, and 5 ounces of silver to the ton. The successful solving by the Consolidated Mining and Smelting Co. of the metallurgical problems connected with the separation and reduction of these lead-zinc ores accounts to a considerable extent for the rapid growth in lead production during recent years. As a result of the low prices prevailing from 1930 to 1935 for lead, zinc, and silver, many of the small silver-lead mines of the Slocan remained idle.

**Other Provinces.**—Occurrences of lead have been found in Gaspé Peninsula and in the Rouyn district of Quebec, but the only production of importance has come from the Notre-Dame-des-Anges district, Portneuf County, where the Tetreault mine produces lead and zinc concentrates. Lead production in Ontario has come chiefly from the Galetta mine and smelter, which closed down in the summer of 1931. An important source of lead in recent years is the silver-lead ores of the Mayo district of Yukon. In 1935 production of silver-lead-zinc concentrates was resumed at the Sterling mine, Richmond County, Nova Scotia, but operations ceased in 1939. Production by provinces in 1938 is shown in Table 6, p. 321.

**World Production.\***—The world production of lead in 1938 was about 1,780,000 long tons. The principal producers were the United States with 18·5 p.c., Australia 15·4 p.c., Mexico 15·6 p.c., and Canada 10·5 p.c.

### Subsection 6.—Nickel.

The Canadian production of nickel has been derived almost entirely from the well-known nickel-copper deposits of the Sudbury district, Ontario. The ore is mined principally for its nickel and copper content but gold, silver, selenium, tellurium, and metals of the platinum group, though present in relatively small quantities, are profitably recovered in the metallurgical processes. The proved deposits of nickel ore in Canada are estimated to be sufficient to provide for world requirements for many years, while there are still large reserves undeveloped.

After the War of 1914-18, the producing companies instituted extensive researches to discover and encourage new peace-time uses for the metal. The success attending their efforts has accounted very largely for the marked increase in production. The automobile industry, electrical machinery, cooking utensils, new submarine cables, and various nickel alloys have all helped to absorb this increased production.

### 18.—Quantities and Values of Nickel Produced in Canada, 1920-39.

NOTE.—Figures for the years 1889 to 1910, inclusive, will be found at p. 368 of the 1929 Year Book and for the years 1911 to 1919 at p. 342 of the 1939 edition.

Year.	Quantity.	Value.	Year.	Quantity.	Value.	Year.	Quantity.	Value.
	lb.	\$		lb.	\$		lb.	\$
1920....	61,335,706	24,534,282	1926....	65,714,294	14,374,163	1933....	83,264,658	20,130,480

			1930....	103,768,857	24,455,133	1937....	224,905,046	59,507,176
1924....	69,536,350	12,126,739 <sup>†</sup>	1931....	65,666,320	15,267,453	1938....	210,572,738	53,914,494
1925....	73,857,114	15,946,672	1932....	30,327,968	7,179,862	1939 <sup>‡</sup> ....	226,105,865	50,920,305

<sup>†</sup> A change in the method of computing the value of nickel production accounts for the drop in value after 1923.

<sup>‡</sup> Preliminary figures.

**World Production.\***—The world production of nickel was about 113,000 long tons in 1938, of which output about 83·0 p.c. was Canadian in origin, while the remainder was derived chiefly from New Caledonia.

### Subsection 7.—Metals of the Platinum Group.

Metals of this group produced in Canada include platinum, palladium, rhodium, ruthenium, osmium, and iridium. Platinum and palladium are of chief importance. Since the early days there has been a small recovery of platinum associated with the gold of the alluvial deposits of British Columbia and other small amounts have been recovered in the refining of base metals at Trail. However, the chief source of the platinum group in Canada is the nickel-copper ore of Sudbury, and the great increase in the output of this ore in recent years has resulted in greater production of the platinum metals, making Canada the leading producing country of the world. The next most important countries are Russia and Colombia.

\* From the Imperial Institute's Statistical Summary.

**19.—Quantities and Values of Platinum and Palladium Produced in Canada, 1921-39.**

NOTE.—Records of platinum production in Canada go back to 1887 but, prior to 1921, the amounts are comparatively small and the basis of calculation was not comparable with that now used.

<sup>1</sup> Includes also rhodium, ruthenium, osmium, and iridium.

<sup>2</sup> Preliminary figures.

**Subsection 8.—Radium and Uranium.**

The silver-pitchblende deposits of the Eldorado Gold Mines, Ltd., at the east end of Great Bear Lake were discovered in 1930. Since that time a modern mining and milling plant has been established at the deposits; extensive improvements in transportation facilities have been introduced over the 1,500-mile route from the railway at Waterways in Alberta down the Mackenzie, up the Great Bear River, and across the lake to the mine; and a plant for the refining of radium and uranium products has been brought into operation at Port Hope, Ont. Silver, copper, cobalt, and lead, as well as radium and uranium, are recovered from the ores. Extensive ore reserves have been indicated at the mine and during 1937-38 the capacity of the refining plant at Port Hope was approximately trebled. Canadian production from this source has resulted in a reduction of the world price of radium by about 62 p.c. from 1933 to approximately \$22 per milligram in 1937, and of about 37 p.c. in the price of uranium salts during the same period. Official production figures are not available for publication, since, because of the limited nature of operations, they would reflect the business of individual companies. At p. 344 of the 1939 Year Book a table that was compiled from various unofficial sources appears, giving the production of radium, and uranium salts for the years 1933 to 1937.

**Subsection 9.—Silver.**

Although no official statistics of the production of silver were published prior to 1887, the annual reports of the operating companies showed that from 1869 to 1885 about 4,000,000 oz. of silver, with a probable value of \$4,800,000, were produced in the Port Arthur district in Ontario.

The current silver production of Canada is derived chiefly from the silver-lead-zinc ores of British Columbia, the silver-lead ores exported from Yukon, and the nickel-copper ores of Ontario. For many years the famous cobalt-silver camp of Ontario supplied the bulk of Canada's silver but this district has been gradually worked out and with the drop in price, which occurred about midsummer 1939, several properties in this once-famous camp were forced to cease operations. An appreciable amount of silver also occurs in the gold ores of northern Ontario; the copper-gold ores of Quebec, Manitoba, and British Columbia; and the pitchblende ores of the Great Bear Lake district in the Northwest Territories. Thus in Canada silver is produced chiefly in combination with other metals.

Silver production in Canada attained its maximum of 32,869,264 fine ounces in 1910 when the famous Cobalt silver camp was at its peak but production from that source has declined since then and now the Sullivan mine in British Columbia, primarily noted for its lead and zinc, is the largest producer of silver in Canada.

### 21.—Quantities and Values of Silver Produced in Canada, 1920-39.

NOTE.—Figures for the years 1887 to 1910, inclusive, will be found at p. 361 of the 1933 Year Book and for the years 1911 to 1919 at p. 344 of the 1939 edition.

### 22.—Quantities and Values of Silver Produced in Canada, by Provinces, 1920-39.

NOTE.—Figures for the years 1887 to 1910, inclusive, will be found at p. 271 of the 1916-17 Year Book and for the years 1911 to 1919 at p. 345 of the 1939 edition. Nova Scotia, Saskatchewan, and Alberta have also shown a small production in recent years, production during 1938 being shown in Table 6 of this chapter, p. 321.

<sup>1</sup> Preliminary figures.

**World Production.**—The world production of silver was estimated by the Director of the United States Mint, as shown in Table 15 of this chapter, p. 336, at 267,913,031 fine oz. for 1938. The silver production of Canada in 1938 was 22,219,195 fine oz., or about 8.3 p.c. of the estimated world total for that year. This placed Canada third, next to Mexico and the United States.

In Table 23 the world production, value, and average price of silver are given for each year from 1900 up to the present. In spite of the decreasing importance of silver, except in China and India, production has increased because of the fact that silver is a by-product in the mining of other metals.

### 23.—Quantities and Values of World Production of Silver, with Annual Average Prices, 1900-38.

(From the Annual Report of the Director of the United States Mint.)

NOTE.—Figures for the years 1860 to 1899, inclusive, will be found at p. 346 of the 1939 Year Book.

<sup>1</sup> At the average par price of a fine ounce of silver in London, excepting the years 1918-22, inclusive, and 1931-38, for which the means of the New York bid and asked prices were used.

<sup>2</sup> Preliminary figures.

### Subsection 10.—Zinc.

The zinc-mining industry of Canada has recently made rapid strides, largely on account of the application of improved metallurgical methods in the treatment of the lead-zinc ores of British Columbia and the production of electrolytic zinc from the Flin Flon copper-zinc ores of Manitoba.

The principal zinc-mining regions of British Columbia are situated in the Kootenay district, where there are large deposits of silver-lead-zinc ore. The chief producing mine is the Sullivan near Kimberley, while other mines are located in the Ainsworth and Slocan divisions of the West Kootenay district. The Britannia mine on Howe Sound, while primarily a copper-gold property, produces zinc concentrates when the market is favourable.

In northwestern Manitoba, the Flin Flon and Sherritt-Gordon mines have ores in which zinc is closely associated with copper and gold, and refined zinc has been made at the Hudson Bay Mining and Smelting Company's smelter from Flin Flon ores since the autumn of 1930. Zinc concentrates were shipped also during 1939 by the Waite-Amulet Mines and by the Normetal Mining Corporation in the Rouyn district. Production by provinces in 1938 is given in Table 6, p. 321.

## Section 5.—Production of Non-Metallic Minerals.

## Subsection 1.—Fuels.

## COAL.

The fuel situation in Canada is somewhat anomalous, as, in spite of the enormous resources of coal in the country, about 50 p.c. of the consumption is imported. The Canadian coal areas are situated in the eastern and western provinces, while the areas of densest population and greatest industrial development in Ontario and Quebec are more easily and economically supplied with coal from the nearer coal-fields of Pennsylvania and Ohio.

**Dominion Fuel Board.**—The Board was created in 1922 to meet the need for a permanent organization responsible to the Government for a thorough and systematic study of the fuel situation and recurrent shortages experienced throughout Canada. It is composed of permanent members of the Dominion Civil Service and the staff of the Board constitutes a division in the Bureau of Mines and Geology, Department of Mines and Resources. In recent years the policy of the Government has been to extend the market for Canadian coal and to that end financial assistance in the form of subventions has been given to the coal industry since 1928, the Board being responsible for the administration of subvention payments. The amount of coal moved under these assisted rates has increased from 146,126 short tons in 1928 to 3,364,882 tons in 1939. Of the total moved under assisted rates in 1939, 2,381,995 tons were from Nova Scotia and 436,092 tons from Alberta and the Crows-nest district of British Columbia.

**Coal Production.**—Production in 1939 was 8.6 p.c. above that of 1938. The average price per ton, which had been \$3.63 in 1928, had dropped to \$3.02 in 1933, and was about \$3.11 in 1939. Nova Scotia was again the leading producer. The coal produced in Nova Scotia, New Brunswick, British Columbia, and Yukon is all classed as bituminous, while Alberta produces bituminous, sub-bituminous, and lignite, and Saskatchewan and Manitoba lignite only.

## 25.—Production of Coal in Canada, by Provinces, 1920-39.

NOTE.—Figures for the years 1874 to 1910, inclusive, will be found at p. 419 of the 1911 Year Book, and for the years 1911 to 1919 at p. 348 of the 1939 edition.

**Coal Consumption.**—The sources of coal consumed in Canada in the calendar years 1920-38 are shown in Table 28, detailed figures of coal *made available for consumption* during 1938 are given in Table 29; the difference between the totals of the two tables in the same year is accounted for by the fact that coal received may be held in bond at Canadian ports and not “cleared for consumption” until required, while coal received in previous years may be taken out of bond (cleared for consumption) in a later year. Normally, the coal made available for consumption is greater than the apparent domestic consumption, since coal is landed at Canadian ports and re-exported or ex-warehoused for ships’ stores without being taken out of bond, but while remaining in bond at the port it is available for domestic consumption if required.

**28.—Consumption of Canadian and Imported Coal in Canada, by Quantities and Percentages, 1920-38.**

NOTE.—Figures for the years 1866 to 1910, inclusive, will be found at p. 354 of the 1921 Year Book, and for the years 1911 to 1919 at p. 350 of the 1939 edition.

<sup>1</sup> The sum of Canadian coal mines’ sales, colliery consumption, coal supplied to employees, and coal used in making coke, etc., less the tonnage of coal exported.

<sup>2</sup> Includes small tonnages from countries other than the United Kingdom and the United States. Deductions have been made from this column to take account of foreign coal re-exported from Canada and bituminous coal ex-warehoused for ships’ stores.

<sup>3</sup> Figures based on estimates of population given on p. 103.

<sup>4</sup> Revised since the publication of the 1939 Year Book.

### 29.—Coal Output, Exports, Receipts from Other Countries, and Coal Made Available for Consumption in Canada, 1939.

NOTE.—For details by provinces, see the Bureau's annual report, "Coal Statistics for Canada".

<sup>1</sup> Includes 293,602 tons from Germany, 43,537 tons from French Indo-China, 20 tons from Norway, and 52 tons from Alaska.

**World Production.**—The total estimated coal production of the world in 1938 amounted to about 1,420,000,000 long tons, a decrease of 6 p.c. from the estimate for the previous year. Germany, which has run second to the United States for each year since 1925, accounted for 26.4 p.c. of world production in 1938; the United States, 24.6 p.c.; and the United Kingdom, 16 p.c. Canada contributed 12,763,141 long tons or about 0.9 p.c.

### 30.—Coal Produced in the Principal Countries of the World, 1913, 1921-38.

NOTE.—For corresponding figures for 1914-20, see 1932 Year Book, p. 281. Figures in this table, except as indicated, are from the Imperial Institute's Statistical Summary.

### NATURAL GAS AND PETROLEUM.

**Natural Gas.**—The producing wells in Eastern Canada are in southwestern Ontario, and near Moncton, N.B. The principal producing fields in Alberta are the Turner Valley (about 35 miles southwest of Calgary), Medicine Hat, Viking (about 80 miles southeast of Edmonton), Redcliff, Foremost, Bow Island, and Wetaskiwin. Wainwright is supplied with gas from the Maple Leaf well in the Fabyan field. Near Lloydminster, in Saskatchewan, a well was brought into production during 1934 and is now supplying that town with gas. In 1939, Ontario was credited with over 57 p.c. of the total value but less than 34 p.c. of the total quantity, while Alberta produced 40 p.c. by value and over 63 p.c. of the total quantity.

### 31.—Quantities and Values of Natural Gas Produced in Canada, by Provinces, 1920-39.

NOTE.—For the years 1892 to 1919, see "Mineral Production of Canada", 1928, p. 188.

<sup>1</sup> Totals for Canada include small productions in Manitoba, Saskatchewan, and Northwest Territories.<sup>2</sup> Preliminary figures.

**Petroleum.**—The Turner Valley field in Alberta is the principal source of production in Canada. After 1933 only the southern end of the field remained available for the acquisition of leases, and in this area a well, Century 1, completed in 1934, produced crude oil instead of naphtha-laden gas. In 1936, Turner Valley Royalties 1, about half a mile to the southwest of Century 1, was completed and brought in as the first big crude-oil producer of Turner Valley. The impetus thus given to the drilling of wells essentially for oil was remarkable. By the end of 1939 about 100 wells had been drilled and only about 3 p.c. failed to prove productive. Of the total over 90 are in the southern part of the field opened up by Turner Valley Royalties 1. Production in many of these wells has been greatly increased by acidization, the effect of which is to open up the pore structure and establish channels for oil to flow more readily to the well. Whether the ultimate production of a well is increased by this treatment has not yet been determined.

The oil from the limestone in the crude-oil area of Turner Valley ranges in gravity from 40° API to 46°, and yields 50 p.c. of straight-run gasoline, differing from most crudes, which yield 30 to 35 p.c. Wide variability in the yield of different wells has been found in the oil area. At the end of 1939 Alberta had produced 27,800,000 bbl.

The rapid growth of crude-oil production in Turner Valley brought with it the problems of transportation and marketing. Tank storage in the field and at Calgary has now been increased so that the pipe-line can handle the demands from the Prairie Provinces and eastern British Columbia. Some oil is also moved from the field by truck. Limited markets have necessitated the curtailment of production and a system of prorationing has been used in Alberta since September, 1937.

The acreage factor has been simplified by allowing only one well to 40 acres.

It is reasonable to expect that, once adequate markets are opened, Turner Valley will not be the only big producer of crude oil in Alberta for the foothills are known to contain numerous structures that offer attractive prospects for oil. Nowhere yet has sufficient development been done to define what may be expected, but wells on the Elbow River and the Clearwater, a right-bank tributary of the North Saskatchewan River, have proved oil to be there in quantity. The region open to prospecting is enormous, extending into British Columbia and the Northwest Territories.

The principal Ontario oil fields are situated in the southwestern peninsula between Lake Huron and Lake Erie. The maximum production of these fields was reached in the '90's and has since declined. In 1939 Ontario's output totalled 206,196 bbl. New Brunswick's small production comes from the Stony Creek field, near Moncton. For the production by provinces in 1938, see Table 6, p. 321.

### 32.—Quantities and Values of Crude Petroleum Produced in Canada, 1920-39.

NOTE.—Figures for the years 1886 to 1910, inclusive, will be found at p. 377 of the 1933 Year Book, and for 1911 to 1919 at p. 353 of the 1939 Year Book.

### Subsection 2.—Other Non-Metallic Minerals.

**Asbestos.**—Canada produces more asbestos than any other country. The value of the annual output of asbestos increased from less than \$25,000 in 1880 to \$14,792,201 in 1920 and \$13,172,581 in 1929. Owing to trade depression, production was much curtailed from 1929 to 1932, as will be seen in Table 33. However, since 1932, production has shown a distinct improvement. In 1938 Canada produced 258,700 long tons, while other leading countries with their production in long tons were: Southern Rhodesia, 52,509; Union of South Africa, 20,668; United States, 11,519; and Cyprus, 9,032. Russian production in 1937 and 1938, as well as the production of several other countries, is not available.

The Eastern Townships of Quebec have for many years been the most productive asbestos-mining area in the world. The most important deposits are: at Black Lake, in Coleraine Township; at Thetford and Robertsonville, in Thetford Township; at East Broughton, in Broughton, Township; and at Danville, in Shipton Township. The veins of chrysotile asbestos vary in width from  $\frac{1}{4}$  inch to  $\frac{1}{2}$  inch and occasionally fibre has been obtained several inches in length. The fibre is of good quality and well adapted for spinning. Both open-cut and underground methods of mining are employed throughout the Canadian asbestos fields. Nearly all the mining companies have installed machinery for the crushing, fibrizing, screening, and grading of the mine product. Some development work has been conducted on an asbestos property at Rahn Lake, Bannockburn Township, Ontario; the fibre in this deposit is reported as being of high quality.

There are 13 plants in Canada that manufacture asbestos products, including the following commodities: asbestos paper and mill board; asbestos roofing of all kinds; asbestos rigid shingles; asbestos building materials; asbestos cellular and sponge-felted pipe insulation; insulating sheets and blocks; asbestos yarn; asbestos dryer felts; asbestos brake linings and clutch facings (woven on special looms); and asbestos packings for steam, oil, and hydraulic operation.

### 33.—Quantities and Values of Asbestos Produced in Canada, 1920-39.

NOTE.—Figures for the years 1896 to 1910, inclusive, will be found at p. 424 of the 1911 Year Book, and for the years 1911 to 1919 at p. 354 of the 1939<sup>1</sup> edition.

<sup>1</sup> The quantities and values of sand, gravel, and rock separated as a by-product in milling asbestos are included in the totals for 1924 and previous years, but are excluded in later years. <sup>2</sup> Preliminary figures.

**Gypsum.**—Many large deposits of gypsum occur throughout Canada, but the production is chiefly from Hants, Inverness, and Victoria Counties, Nova Scotia; Hillsborough, New Brunswick; Hagersville and Caledonia, Ontario; Gypsumville and Amaranth, Manitoba; and Falkland, British Columbia. The Hillsborough

deposit of gypsum in New Brunswick is of very high grade. The greater part of Canada's production is exported in crude form from the Nova Scotia deposits, which are conveniently situated for ocean shipping and during recent years account for about 80 p.c. of the total Canadian production. Production of gypsum in Canada reached its highest point in 1928 with 1,246,368 tons valued at \$3,743,648. Production during 1938 was 1,008,799 tons valued at \$1,502,265, and preliminary figures for 1939 are 1,408,188 tons valued at \$1,922,957. The production by provinces during 1938 is shown in Table 6, p. 322.

**Salt.**—The greater part of the Canadian salt production comes from wells located in southwestern Ontario, but the Malagash deposits in Nova Scotia have shown an increasing production in recent years. The first production of commercial importance in Manitoba was recorded in 1932 and for Saskatchewan in 1933, while some commercial shipments have been made from deposits near McMurray in Alberta. An important part of Canadian salt production (38.6 p.c. in 1938) is used in the form of brine in chemical industries for the manufacture of caustic soda, liquid chlorine and other chemicals.

The Canadian production during the present century has shown fairly steady growth from 59,428 tons in 1901 to 91,582 in 1911, 164,658 in 1921, 262,547 in 1926 and 330,264 in 1929, a record at that time. Production declined to 259,047 tons in 1931 but has since recovered, and in 1938 440,045 tons, valued at \$1,912,913, were produced. (See Tables 2 and 6, pp. 317 and 322.) The estimate for 1939 is 424,500 tons, valued at \$2,486,632.

## Section 6.—Production of Clay Products and Other Structural Materials.

Production of these materials is naturally dependent upon the activity of the construction industry in Canada. Building and construction work fluctuates widely with business cycles and during the recent depression dropped to a very low ebb. Under these circumstances, the production of clay products, cement, gravel, and stone was severely curtailed. Some uncompleted large engineering construction operations and governmental relief projects eased the decline in the early years of the depression but the downward trend was still evident in 1933. With a slight recovery of construction activities since then (see Chapter XV) there has been a moderate increase in the production of the chief structural materials, the total reported value of production being \$34,274,543 in 1939 as compared with \$16,696,687 in 1933.

**Brick and Tile.**—Although the brick and tile industry is established in every province of the Dominion, production is naturally greatest near the chief centres of population, that is, in Ontario and Quebec. Production fluctuates with building activity and reached its highest point in the year 1912. Since that time the gradual substitution of steel and reinforced concrete for brick has reduced the production of brick so that, while the value of construction undertaken in 1928 or 1929 is estimated to have exceeded that of 1912, the quantity of brick produced in the later years was only about half that of 1912. On the other hand, as will be seen from Table 34, the production and consumption of cement in 1929 greatly exceeded that of 1912 or 1913. The production of building brick of various types in 1936, 1937,

and 1938, is shown in Table 2 of this chapter, while the production by provinces in 1938 is given in Table 6. The estimated value of all clay products made in 1939 was \$4,984,491.

**Cement.**—The cement industry in Canada began with the manufacture of hydraulic or natural rock cement. The first production was probably at Hull, Quebec, between 1830 and 1840. The manufacture of Portland cement began about 1889. Owing to its superiority in uniformity and strength, it soon superseded the older product. Portland cement consists of an accurately proportioned mixture of lime, silica, and alumina. The lime is usually furnished by limestone and the silica and alumina by clay or shale. The cement industry has naturally become established where these materials are situated and where fuel supplies and transportation are readily available. The largest production is in Quebec and Ontario, although there are also active plants in Manitoba, Alberta, and British Columbia. As may be seen from Table 34, production declined greatly from 1929 to 1933, but has recovered somewhat since then. Production by provinces in 1938 is given in Table 6, p. 323.

### 34.—Production, Imports, Exports, and Apparent Consumption of Portland Cement, by Quantities and Values, 1920-39.

NOTE.—Figures for the years 1910 to 1919, inclusive, will be found at p. 356 of the 1939 Year Book.

<sup>1</sup> 'Production' as used here means quantity and value of sales.  
or 3½ cwt.

<sup>2</sup> Preliminary figures.

<sup>3</sup> The barrel of cement=350 lb.

**Sand and Gravel, and Stone.**—The Mining, Metallurgical and Chemical Branch of the Bureau of Statistics presents details of production and organization of the stone industry separately from that of sand and gravel, but for the sake of brevity they are here discussed together. However, the figures of stone production shown do not include the limestone used to produce lime and cement, nor the quartz and other rock minerals, which are shown separately in Table 2, p. 317. The production of these materials increased greatly up to the recent world depression. The expansion in the stone industry was chiefly in crushed stone. Thus a production of crushed stone in 1922 of 3,044,399 tons had increased by 1930 to 8,062,330 tons, while in the same period the production of sand and gravel increased from 11,666,374 tons to 28,547,511 tons. During the depression the output contracted sharply, but

since 1933 there has been some recovery. Among the developments in Canada that resulted in increased production of these materials prior to the depression may be mentioned: (1) the tendency for brick to be replaced by reinforced concrete, cement blocks, etc., as indicated at p. 350 by a decline in brick production and an increase in that of cement; (2) the extensive improvement during that period in the mileage and character of roads and highways in Canada; and (3) the improvement of railway roadbeds.

The provincial distribution of the 1938 production of sand and gravel, and stone, is shown in Table 6, p. 323, while the chief purposes for which these materials were produced are shown in Table 35. Sand and gravel production in 1939 totalled 28,172,384 tons valued at \$10,820,631, and stone production amounted to 5,468,174 tons valued at \$5,952,242.

<sup>1</sup> Relatively small and included with "For concrete, roads, etc.". not specified.

<sup>2</sup> Totals include minor items

The quantities and values of stone produced, given in the table above, represent only the production of those establishments that actually quarry their own stone and are exclusive of the products of the stone-dressing industry comprising those establishments that buy rough stone and dress, polish, or finish it; although dressing operations are frequently carried on right at the quarry and to that extent cannot be separated from the primary production. Of the total quantity of stone produced in 1938 about 84 p.c. was limestone, 14 p.c. granite, 2.0 p.c. sandstone, and 0.4 p.c. marble. The average value per ton was \$0.90 for limestone, \$1.91 for granite, \$2.14 for sandstone, and \$4.50 for marble. The marble was used chiefly for stucco dash, in glass factories, pulp and paper mills, and other industrial processes, for poultry grit, and pulverized as whiting. Large quantities of limestone were used for fluxing and other chemical purposes, but by far the largest part of all stone except marble was used as crushed stone.

Subsection 1. Historical and General Statistics.....	367	SECTION 4. POWER GENERATED FROM FUEL.....	390

This chapter of the Year Book has been broadened to cover all power, however generated, and its utilization. Certain sections, such as those dealing with power utilization in industry and power generated from fuel, are based on material formerly appearing in the Manufactures Chapter, combined with similar but new data covering the mining industry. Other sections are entirely new and cannot be regarded as complete owing to insufficiency of available data. The purpose has been to co-ordinate all information respecting power generation and utilization instead of limiting this chapter, as in the past, to water power as a natural resource and a review of central electric stations.

### Section 1.—Water Power.

The fresh-water area of Canada is officially estimated at 228,307 square miles an area nearly twice as large as the whole land area of the British Isles, and certainly larger than the fresh-water area of any other country in the world. As many parts of this well-watered country are situated at considerable heights above sea-level, there are great sources of potential energy in the rapids and waterfalls of the rivers conveying the waters from these areas to the sea. Water power, therefore, is among the chief natural resources of Canada, and its development has in recent years contributed materially to swell the volume of Canadian production.

#### Subsection 1.—The Water-Power Resources of Canada and Their Utilization.

In considering the relative importance of different natural resources, the inherent quality of inexhaustibility by use that water power possesses places it in a unique position—its use by industry in no way limits the ever-recurring cycle of evaporation, condensation, precipitation, and run-off by which its supply is renewed.

Another significant feature, as affecting Canada, is the fortunate occurrence of large water-power resources in what has been termed “the acute fuel zone” where native coal is not conveniently or economically available. The Provinces of Ontario and Quebec, without native coal, include the principal centres of population and manufacturing, and abound in many raw materials of industry; they contain

\* Section 1 of this chapter has been revised under the direction of J. T. Johnston, Controller, Dominion Water and Power Bureau, Surveys and Engineering Branch, Department of Mines and Resources, and Sections 2, 3 and 4 (except as otherwise stated) by G. S. Wrong, B.Sc., Chief, Transportation and Public Utilities Branch, Dominion Bureau of Statistics.

within their borders more than half of the total available water-power resources and more than three-quarters of the developed water power of Canada. In the Maritime Provinces and in British Columbia the incidence of water power in proximity to large supplies of pulpwood has also been favourable.

Canada's geological formations, climate, and topography have resulted in: the creation of great fresh-water areas; the gathering of the resultant run-off into river systems; and the concentration of river flow into natural reservoirs and power heads, or at least into areas where such can be economically created by artificial means.

Geologically, Canada is divided into six main regions: the Precambrian or Canadian Shield, the St. Lawrence Lowland, the Cordilleran, the Appalachian and Acadian, the Interior Plains, and the Hudson Bay Lowland. The boundaries of these regions are shown on the map of the Water Powers of Canada, facing p. 356, as well as on the geological charts on p. 15 and facing p. 24 of the 1939 Year Book. The Canadian Shield, St. Lawrence Lowland, and Cordilleran Regions include predominant proportions of both resources and present installation; the greatest power rivers have their sources either in the Precambrian Shield or in the Cordilleran Region.

**The Precambrian Region.\***—Slightly more than one-half Canada's area of 3,695,000 square miles lies in the geologically old and time-worn Precambrian Region or Canadian Shield. Large areas of it are rocky and have scant surface resources but are proving abundantly rich in mineral deposits. This Region comprises almost the entire continental portion of Canada lying north of a line starting on the eastern coast opposite Newfoundland and following the northern boundary of the depressed area occupied by the St. Lawrence River, westward to Lake Ontario. From this point the line runs westerly to Georgian Bay, then skirts the north shore of Lake Huron and, entering the United States, sweeps around the ancient depressed area occupied by Lake Superior to re-enter Canada at Lake of the Woods; from this point it runs northwesterly to skirt the eastern shore of Lake Winnipeg. From Lake Winnipeg the line bears northwest to the western end of Lake Athabaska and passes through the basins of the Great Slave and Great Bear Lakes, reaching the Arctic Ocean to the east of the Mackenzie River delta.

The Shield contains in the basins and waters of its main rivers, innumerable natural storage reservoirs and outstanding water-power sites. It is estimated that the water-power resources of the Shield aggregate almost 20,000,000 h.p., warranting a total turbine installation of probably 26,000,000 h.p. At the present time the installed capacity of water-power plants throughout the area totals 4,730,000 h.p., or about 18 p.c. of the available resources. In the westerly portion of the Shield the Churchill and Nelson Rivers, in addition to waters from the Shield itself, receive drainage from the Interior Plains and the Cordilleran slopes of British Columbia, and in northern Saskatchewan and Manitoba have a power capacity of between 3,000,000 and 4,000,000 h.p. The Winnipeg River has a potential capacity of more than 1,000,000 h.p. and a present installation of 450,000 h.p. Easterly, the Shield is the source of the basic hydro-power for the development of the great mineral and timber wealth of northern Ontario and Quebec, including the 3,400,000 h.p. of the Albany, Mattagami, Abitibi, Harricnaw, Nottaway and other rivers flowing into Hudson Bay and of the 210,000 h.p. of the Kaministiquia and Nipigon Rivers.

\* The Hudson Bay Lowland skirting the south shore of Hudson Bay is, for the purposes of this article, included in this Region.

# WATER POWERS OF THE DOMINION OF CANADA

Scale of Miles  
 100 50 0 100 200 300 400

Farther east, the industries of eastern Ontario and the Ottawa and St. Lawrence Valleys draw their power from the 2,450,000 h.p. resources of the Gatineau, Lièvre, St. Maurice, and Saguenay Rivers flowing south from the Shield to the Ottawa and St. Lawrence Rivers; and from the 1,310,000 h.p. of the Ottawa, three-quarters of which lies within the Shield. The Bersimis, Outardes, Manikouagan, and other great rivers entering the St. Lawrence east of the Saguenay have resources totalling 2,400,000 h.p.

**The St. Lawrence Lowland Region.**—This Region ranks second in resources and installation and embraces an area of 35,000 square miles extending from a short distance east of Quebec City to Lake Huron, south of Georgian Bay.

The water-power resources of this lowlands region, estimated at more than 6,000,000 h.p., are principally in the Niagara, St. Lawrence, and lower Ottawa Rivers, with powers of lesser magnitude on the Trent, Richelieu, and other tributaries. The present total development is almost 2,000,000 h.p. and substantial quantities of power, developed from rivers in the adjacent Canadian Shield, and Appalachian areas are transmitted into the St. Lawrence Lowlands.

The Niagara, under present treaty limitations, already produces and makes available for distribution in Canada a total of 800,000 h.p. with complete protection of the great scenic value of Niagara Falls. The vast industrial structure of southern and western Ontario now rests largely upon this great development.

The St. Lawrence River, between Lake Ontario and Montreal, has potential power resources totalling 5,000,000 h.p., of which about 4,000,000 h.p. are wholly located in Canada. This great power, of which more than 750,000 h.p. is already developed, coupled with the low-cost water-borne traffic of the Great Lakes and St. Lawrence River, which renders accessible the raw materials of almost half the continent, is a potential asset of very great value to the Dominion.

**The Cordilleran Region.**—This division which forms the western portion of the Continent consists of three roughly parallel mountain belts, the eastern belt comprising the Rocky and Mackenzie Mountain Ranges, the central belt comprising a series of plateaux and mountains, and the western belt, lying west of the plateau country comprising the coastal and insular mountain ranges.

On the eastern slope of the Rocky Mountains low-head sites are found on the main rivers and high-head sites, combined with areas adaptable for storage, on their tributaries. On the western slope of the Rockies and the eastern slope of the central belt, the streams are short and swift with many high-head power sites although few of them are of large capacity, the chief power sites being on the Bull and Elk Rivers in the southern section. In the central belt of plateaux and mountains there are large power resources on the main rivers, which flow through wide valleys and collect the flow of numerous tributaries. The western belt of the Cordilleran Region has many high-head sites for some of which storage and concentration of flow by the diversion of smaller streams provide great power possibilities. In addition there are valuable resources in the lower-head sites of some of the larger rivers, notably the Fraser and Skeena.

The water-power resources of the Cordilleran Region have been estimated at 5,200,000 h.p., warranting a turbine installation of approximately 6,800,000 h.p. Detailed studies of the run-off characteristics, of the possibilities of storage, of diversions from one watershed to another, and of the development of high heads, will unquestionably greatly increase this figure.

Hydro-energy has had widespread application to the development of other rich resources of the district. Hydro-power from the Klondike River drives the great placer gold-mining dredges of the Yukon Territory. In the far south, approximately 250,000 h.p. from the Kootenay River, is the foundation of the immense mining, metallurgical, and electro-chemical operations at Trail, with their production of zinc, lead, and fertilizer for world markets. In Fernie district, in the southeast, and on Vancouver Island, hydro-power operates the coal mines, while along the coast great pulp, paper, and lumber mills at Powell River, Ocean Falls, and other points are based on hydro-power.

The development of water power in the Cordilleran Region has grown very rapidly, and there is now a total installed capacity of 737,000 h.p. An exceptionally wide urban and rural distribution exists carrying the comforts of electrical conveniences to a large percentage of the population. Vancouver Island is well served with hydro-power.

**The Appalachian and Acadian Region.**—This comprises the Maritime Provinces and that portion of eastern Quebec south of the St. Lawrence River and east of Quebec City south of the St. Lawrence Lowland. This area is drained by numerous rivers, many of them short and with relatively small drainage basins but with steep descents.

The Appalachian and Acadian Region includes hydro-power resources totalling 550,000 h.p., which would sustain a turbine installation of about 700,000 h.p. An extensive development aggregating more than 400,000 h.p. has already taken place. Of the power rivers worthy of special mention, the Mersey in Nova Scotia has an extensive present development; the Saint John in New Brunswick is a power river of considerable proportions; while the St. Francis River in Quebec, lying in the western fringe of the area, has outstanding power resources, a large part of which is now developed.

Industrial progress and domestic comfort, based upon low-priced hydro-power, have contributed greatly to the economic and social progress of the Region. Hydro plants serving the publicly and privately owned transmission and distribution systems of Nova Scotia, New Brunswick, and eastern Quebec, as well as privately controlled industrial enterprises, provide substantial supplies of power for industry and for domestic use. Most of the leading municipalities and industrial centres of the Maritimes and southeastern Quebec are served with hydro-power. Major pulp and paper enterprises are so supplied at Liverpool, Nova Scotia; Edmundston and Dalhousie, New Brunswick; and Windsor Mills, Bromptonville, and East Angus, Quebec; while the famous asbestos mines of the Eastern Townships of Quebec are also hydro-operated.

**The Interior Plains Region.**—This is roughly a triangular area with its base on the International Boundary and its apex on the Arctic Ocean at the mouth of the Mackenzie. It is bounded on the east and north by the Canadian Shield, and on the west by the easterly range of the Cordilleran Region. The Plains are covered with great depths of soil, through which the streams cut themselves down into deep couleés and the rivers into deep, wide valleys. The rivers and streams generally flow with gradual gradient and few rapids or falls occur, the main water-power resources available for the Plains area being those located near its border in either the Cordilleran or Precambrian Regions.

The geological structure of the southern plains is such that there is no concentration of river flow into natural heads suitable for the development of power. In the northern areas, however, on such rivers as the Saskatchewan, Athabaska,

Peace, and Slave, rapids which offer possibilities of substantial development occur. It is estimated that the water-power resources of the Interior Plains Region total 1,800,000 h.p.

**The Hudson Bay Lowland Region.**—This division borders the southern and western shores of James Bay and the south shore of Hudson Bay. It is so remote and possesses so few water powers that its resources, for the purpose of this article, have been included with those of the Canadian Shield. With the exception of some sites on the lower Nelson River its water-power resources are negligible.

### Extent of Canada's Available and Developed Water-Power Resources.

The chart below and Table 1 show the provincial distribution of available and developed power as at Dec. 31, 1939. These estimates are the result of a systematic study of all existing stream flow and power data available from Dominion, provincial, and private sources. The figures of available water power are based upon rapids, falls, and power sites of which the actual drop or the head possible of concentration has been measured, or at least carefully estimated. Many unrecorded rapids and falls of undetermined power capacity exist on rivers and streams from coast to coast. These will become available for tabulation only as more detailed survey work is completed; this is particularly true in the less explored

northern districts. Also, no consideration has been given to the power concentrations that are feasible on rivers and streams of gradual gradient, where economic heads may be created by the construction of power dams, unless definite studies have been carried out and the results made matters of record. In brief, figures of available power quoted represent only the *minimum* water-power possibilities of the Dominion.

The total turbine installation of 8,289,212 h.p. represents the sum of the manufacturers' ratings of the different units under the heads at which they are installed. It is not correct to subtract this figure from the totals of available power in columns 1 or 2 to determine what power remains undeveloped because it has been proven sound practice to allow a turbine installation averaging 30 p.c. in excess of the power at ordinary six-month flow. On this basis the 'at present' recorded resources will provide for a total turbine installation of 43,700,000 h.p. The present turbine installation, therefore, indicates the development of only slightly less than 19 p.c. of the present recorded water-power resources of Canada.

**1.—Available and Developed Water Power in Canada, by Provinces, as at Dec. 31, 1939.**

Province or Territory.	Available 24-Hour Power at 80 p.c. Efficiency.		Turbine Installation.
	At Ordinary Minimum Flow.	At Ordinary Six-Month Flow.	
	h.p.	h.p.	h.p.
Prince Edward Island.....	3,000	5,300	2,617
Nova Scotia.....	20,800	128,300	131,717
New Brunswick.....	68,600	169,100	133,347
Quebec.....	8,459,000	13,064,000	4,084,763
Ontario.....	5,330,000	6,940,000	2,596,799
Manitoba.....	3,309,000	5,344,500	420,925
Saskatchewan.....	542,000	1,082,000	90,835
Alberta.....	390,000	1,049,500	71,997
British Columbia.....	1,931,000	5,103,500	735,013

<b>Canada.....</b>	<b>20,347,400</b>	<b>33,617,200</b>	<b>8,289,212</b>

The favourable distribution of water-power resources and of developed power and especially the occurrence of power resources in the industrial provinces and in proximity to the largest known mineral deposits and pulpwood supplies are factors of great importance. About 60 p.c. of the available power and 81 p.c. of the developed power are found in the highly industrialized Provinces of Ontario and Quebec which contain 61.5 p.c. of Canada's population and which, because they do not possess coal mines, would otherwise be dependent to a far greater extent on imported coal for the production of power.

### Comparison of the Water-Power Resources of Canada with Those of Other Countries.

Many difficulties are encountered when comparison of water-power resources between different countries is attempted. Incomparability and incompleteness of statistics are the chief drawbacks. This is more especially the case when undeveloped resources are considered, for only crude estimates are possible for many countries where resources are, in large measure, unexplored.

During recent years, in its Statistical Year-Book, the World Power Conference has attempted a statistical compilation of power resources, development, and utilization upon a comprehensive and comparable basis. In this effort a useful beginning has been made in the matter of water-power resources but, in the most recent Year-Book, statistics are still lacking for a number of countries known to have important developed and undeveloped resources. Taking cognizance of data collected by the World Power Conference and amplifying them by more or less approximate information available from other sources, the Geological Survey of the United States Department of the Interior has compiled an estimate of the developed and potential water power of the world.\* In this estimate the figures for many countries are undoubtedly rough approximations only, owing to the lack of reliable data. Nevertheless, the estimate is probably as good as can be made under present conditions and serves a useful purpose.

For the world as a whole the United States Geological Survey estimate shows the developed and potential water-power resources for continental areas as follows:—

Continent.	Developed Power. <sup>1</sup>	Potential Power. <sup>2</sup>
	h.p.	h.p.
Africa.....	183,000	274,000,000
Asia.....	6,100,000	151,000,000
Europe.....	28,000,000	74,000,000
North America.....	27,000,000	77,000,000
Oceania.....	800,000	21,000,000
South America.....	1,400,000	74,000,000
Approximate Totals.....	64,000,000	671,000,000

<sup>1</sup>Capacity of installed machinery at constructed plants.  
p.c. efficiency.

<sup>2</sup>Based on ordinary minimum flow at 100

These figures indicate that the potential resources of the Continents of Africa and Asia, combined, represent more than 63 p.c. of the world total, whereas the total development that has been made in these two continents is less than 10 p.c.

\* See "Developed and Potential Water Power of the World", Bulletin 63107, published by the Geological Survey, Department of the Interior, Washington, D.C., U.S.A., June 23, 1939.

of the development in the world at large. Enormous potential resources exist on the great river systems of Africa and Asia but these resources are so remote from any present prospect of power markets that they are of little economic interest. The same may be said of substantial resources that exist in parts of South America and Oceania.

It is of greater interest, therefore, to compare the developed and potential resources of those countries in which the development and utilization of water power has progressed to a considerable extent. With this in view, countries listed by the United States Geological Survey as having developed water-power resources of 100,000 h.p. or more are arranged in the following table in order of magnitude. An additional column has been inserted indicating, as far as the latest population figures permit, the per capita water-power installation in each country.

**2.—Developed and Potential Water-Power Resources of Countries Having Developed Resources of 100,000 or More Horse-Power.**

Ireland (Eire).....	140,000	0.047	300,000
Roumania.....	127,000	0.006	3,000,000
Java.....	125,000	0.003	1,100,000
Peru.....	100,000	0.014	6,400,000
<b>Totals.....</b>	<b>62,910,678</b>	<b>-</b>	<b>302,550,000</b>

This table shows that, in developed power, Canada stood second in 1938 among the countries of the world, being exceeded only by the United States. In per capita installed power Norway took the lead, Newfoundland stood second, and Canada third. In potential water-power resources, Canada is shown as ranking fifth among the countries listed. Canada's position, however, is much more favourable if account is taken of the availability of power resources to prospective markets. Although many of Canada's large undeveloped water powers are situated in the more

remote and uninhabited parts of the country, there are, as well, great reserves of undeveloped power within ready transmission distance of existing centres of population and industry. It is not believed that this favourable condition exists to the same extent in countries such as Russia, India, and Brazil, and, excluding these countries, it is seen that, of the others listed, Canada is outranked only by the United States in potential resources.

In comparing the estimates of potential power with those of developed power and also in estimating the proportion of a nation's water-power resources already developed it should be kept in mind that the estimates of developed power are based on the installed capacity of hydraulic turbines and water wheels at constructed plants which average two or three times the potential power at low flow at the same sites. In Canada, for example, it is estimated that, under existing practices, the potential water-power resources of the country would support an installed turbine installation of probably 43,700,000 h.p. In other words, the present installation represents less than 19 p.c. of the country's total resources. The same holds true in regard to figures shown for other countries.

### **Problems in the Development of Hydraulic and of Hydro-Electric Power.**

The national importance of water-power resources was immeasurably increased by the development of the electric generator. Later the application of the voltage transformer and high-tension transmission permitted the concentration and utilization of power at points remote from its origin where favourable conditions of labour, transportation, and raw materials existed or could be readily provided.

The earlier utilization of electricity was almost entirely for street, commercial, and household lighting. Its application to urban and interurban transportation quickly followed and with the perfecting of industrial machinery suitable for electric drive it soon became the leading motive force in industry. Next came its application to specialized industrial heating, and, more recently, its application to many electro-metallurgical and electro-chemical processes resulting in the large-scale production of electrolytic copper, aluminium, zinc, nickel, and other metals, calcium carbide, carborundum, inorganic fertilizers, weed killers, and elemental and other gases.

The abundant supply of low-cost hydro-electric power has been an important factor in the rapid growth of the manufacturing and mining industries in Canada. The accompanying demand for electric power, much of it necessarily transmitted over considerable distances, brought with it many problems of generation and transmission. These problems have been vigorously attacked and a high technique of successful year-round operation has been developed despite extreme variations of temperature experienced in many parts of the country.

The low temperatures experienced during the winter months necessitate the installation of heating apparatus, either steam or electric, for the maintenance of gate operation and to prevent the accumulation of ice on the trash racks. Special provision is also necessary in the design of waterway entrance structures to preclude the entry of floating ice and reduce the possibility of frazil- and anchor-ice formation. Also insulation or heating equipment has to be installed for the protection from freezing of the surge tanks built into the intake equipment to reduce the

momentum of the water against the turbine gates when the flow of water to them must be reduced or closed off suddenly. Ice cover on the water in the tank damages its interior supports in the event of rapid changes of level.

Fuel-operated auxiliary equipment is sometimes installed to supply power in the event of the hydro equipment becoming inoperative from any cause, but so dependable have Canadian hydro-electric installations proven that the central electric station industry, which operates 88 p.c. of Canada's developed water powers, maintains less than 200,000 h.p. of such auxiliary equipment for the more than 7,200,000 h.p. of hydraulic turbines, as shown in Table 3.

**The Generation of Electric Energy.**—Electric generators in use in Canada are almost exclusively for the production of alternating current, considerably less than 1 p.c. of the more than 6,000,000 kilowatts of generating capacity installed in central electric stations being direct current.

In the generation of alternating current in Canada two frequencies may be said to be standard, 25 and 60 cycles per second. The original developments at Niagara Falls were made with a frequency of 25 cycles and this frequency has been adhered to when additional power for that area has been provided. This frequency is also used in some of the plants supplying the mining areas of northern Ontario but elsewhere in Canada generation at a frequency of 60 cycles is general. Where interconnection is made between the two systems, frequency changers are installed.

Alternating current generators are in operation in Canada up to 55,000 kva., the largest direct current generator in central-station use being 750 kw., although some larger units are in use in electric railway and industrial plants.

Electricity is generated at voltages up to 14,000 and this voltage is raised as circumstances require to varying voltages up to 220,000 for transmission.

**The Transmission of Electric Energy.**—Until almost the beginning of the present century it was believed that any attempt at the long-distance transmission of electricity would prove uneconomic because of the amount of current absorbed or lost in transmission. The development of the high-tension transformer and of improved insulating materials resulted in the construction, in 1897, between St. Narcisse and Three Rivers, Quebec, of an 11,000-volt line, 18 miles in length, the first high-tension transmission line in the British Empire. Since that time continued technical advances have resulted in a steady growth in transmission distances and voltages in Canada, until at present power is being transmitted, for instance, from the Gatineau River in Quebec to Toronto, a distance of 225 miles, at 220,000 volts. Greatly improved technique has also been developed in switching control and protective equipment.

In general, electricity is generated at voltages between 6,000 and 14,000. The power is then passed through transformers which raise it to a voltage predetermined by considerations of distance, amount of power to be carried, and relation between the value of the power carried and the cost of the transmission line.

**Conductors for Transmission Lines.**—Copper and aluminium are the principal materials used for conductors for long-distance electric transmission although in some cases, where small amounts of power are to be transmitted, iron wire is used. Copper-clad steel wire is used to a considerable extent for special crossings where great strength is required. Steel-reinforced aluminium cable is in general use when large quantities of power are transmitted as it is much stronger than copper of the same conductivity and weight. The steel core provides the strength and the aluminium cable the conductance.

*Transmission-Line Insulation.*—Two widely different types of porcelain transmission-line insulators are in common use, viz., the pin type, generally used for voltages up to 66,000, and the suspension type for voltages from 66,000 to 220,000. Each suspension unit has a length of about five inches and, as ten or more units may be combined, the tendency of voltage to concentrate on the units nearest to the line is sometimes reduced by the use of grading shields. These shields, in addition to providing a comparatively uniform voltage distribution over the insulator, also tend to reduce damage from 'arcing' in the case of flashover across the insulators from lightning or other causes. Additional protection from lightning is sometimes provided by the use of overhead ground wires, i.e., by one or more wires placed above the current-carrying wires and connected to the ground at frequent intervals. Lightning arresters are also sometimes connected between the line and ground for the protection of the line and transformers.

### The Merchandising of Power.

Three main types of service are provided by central electric stations, i.e., by organizations engaged in the sale of electricity. The first is the supplying of primary firm power, the highest type of service and commanding the highest price. This power is available to the consumer at uniform voltage, up to the amount of his contract, twenty-four hours per day. In general its cost varies from about \$10 per horse-power year to large users under long-term contracts and close to the point of generation to say \$50 per horse-power year to consumers of small blocks, on shorter contracts, and/or at greater transmission distances.

The second class of service is the supplying of primary interruptible power, i.e., power sold subject to certain limitations as to continuity of supply. Organizations selling electricity must install sufficient equipment to meet the maximum or peak demand of the firm-power customers. A market for power that can be produced in off-peak periods—times when the power customers are taking less than their maximum contract amounts—is found in the sale of primary interruptible power. Large industrial users, able to adjust their power requirements under special circumstances, purchase this power at considerable reductions from the cost of firm power.

The third class of service is the supplying of secondary or 'at will' power. The amount of such power that can be supplied at any time is indefinite and service is not guaranteed. Service can be discontinued at any time without notice to the customer. The price range for such service is quite wide, much of it being supplied at very low rates, in some cases as low as \$2 per horse-power year. The power is used where conditions will not permit the use of high-cost power. Much of it is used by the pulp and paper industry for steam generation. Steam cannot be produced by electricity in direct competition with coal except where surplus or off-peak power can be purchased at low rates, but in times of industrial depression, when much central-station equipment would be operating below capacity, a market is found for its output by selling it for steam generation at low rates. During 1938, 32 p.c. of the total output of central stations was used by the pulp and paper industry, almost half of which was secondary power for boilers.

Much of the continued growth in the consumption of central electric station power is due to the merchandising and educational campaigns of the electrical utility organizations. This is particularly the case in regard to domestic consumption.

The direct advertising in this field, coupled with instalment financing, has resulted in substantial load increases in many cases. In the industrial and commercial field sales promotion has also been beneficial to the power-selling organizations.

### Subsection 2.—Historical Statistics of Water-Power Development and Analysis of Hydraulic Installations.

**Historical Statistics.**—The commencement of the long-distance transmission of electricity at the beginning of the present century resulted in the extensive development of hydro-electricity for distribution over wide areas. The growth of installation during the period from 1920 to 1939 is shown, by provinces, in Table 3.

### 3.—Hydraulic Turbine Horse-Power Installed in Canada, by Provinces, as at Dec. 31, 1920-39.

NOTE.—Comparable statistics for the years 1900-19, inclusive, are given at p. 361 of the 1939 Year Book.

Year.	P.E.I.	Nova Scotia.	New Brunswick.	Quebec.	Ontario.	Manitoba.	Saskatchewan.	Alberta.	British Columbia.	Total. <sup>1</sup>

<sup>1</sup> Includes totals for Yukon. Turbine horse-power in Yukon was 13,199 from 1920 to 1934, and 18,199 from 1935 to 1939.

**Analysis of Total Hydraulic Power Installations.**—For the purpose of this review, the present total installation of 8,289,212 h.p. is divided in Table 4 under three main headings: central electric stations, pulp and paper mills, and installations for other purposes.

The largest and most rapidly growing of these three classes, viz., central electric stations (a complete survey of central electric stations is given in the subsections of Section 2), maintains 87.9 p.c. of Canada's present development, and produces 98 p.c. of all electricity sold in and exported from the country.

The pulp and paper industry accounts for a hydraulic installation of 649,801 h.p. or 7.9 p.c. of the total. It is not possible to state definitely what proportion of this is utilized in the generation of electricity for the operation of motor drive, but latest census figures indicate an approximate figure of 350,000 h.p. The industry, of course, uses a much larger percentage than this 649,801 h.p. because pulp and paper mills purchase about a third of the output of central electric stations and use more than 45 p.c. of such purchased power for motor drive. The latest census figures available indicate that Canada's pulp and paper mills maintain an electric-motor installation approximating 1,250,000 h.p. for operation by this power. The remaining 55 p.c. of the purchased power is utilized for steam-raising in electric boilers.

Column 3 of Table 4 lists the hydraulic installation of other than central electric stations and pulp and paper mills—a total of 346,912 h.p. The figures include all water-power installations supplying electric or hydraulic power to the mineral and electro-chemical industries, municipal pumping plants, electric railway plants, and the multitudinous saw, grist and grinding mills and other manufacturing industries throughout Canada. Here again no definite division between purely hydraulic and hydro-electric drive is possible.

**4.—Developed Water Power in Canada: Distribution by Provinces and Industries, and per 1,000 Population, as at Dec. 31, 1939.**

Province or Territory.	Turbine Installation in H.P.				Population, June 1, 1939. <sup>4</sup>	Total H.P. Installation per 1,000 Population.

Percentages of total instal- lation.....	87.9	7.9	4.2	100.0	-	-

<sup>1</sup> Includes only hydro-electric stations that develop power for sale. <sup>2</sup> Includes only water power *actually developed* by pulp and paper companies. In addition to this turbine installation, pulp and paper companies have motor equipment for operation by hydro-electricity purchased from central electric stations aggregating more than 1,225,000 h.p., making a total of more than 1,875,000 h.p. actually developed for the manufacture of pulp and paper. Large amounts of electricity are also purchased for use in electric boilers rated at more than 1,750,000 h.p. <sup>3</sup> Includes only water power actually developed in connection with industries other than the central electric station and pulp and paper industries. These industries also purchase power from central electric stations. <sup>4</sup> Estimated by the Dominion Bureau of Statistics.

The figures of turbine installation given above must not be placed in direct comparison with those of the annual central electric station census nor those of the census of the pulp and paper industry because of the different bases of compilation. The figures of hydraulic installation represent the cumulative totals of

installation for the purposes named, adjusted by deducting the capacity of installations removed because of obsolescence or for other reasons. The Census of Industry data are computed on a different basis, representing only the sum of the installation in the plants actually in operation during the year dealt with in the Census and not total installation. Also, data on installations are available as soon as equipment is installed, whereas census data for any period are necessarily available some time after the end of the period.

## Section 2.—The Central Electric Station Industry in Canada.

Central electric stations are defined as companies, municipalities, or individuals selling or distributing electric energy, whether generated by themselves or purchased for resale. Actually, generating stations may also purchase some power to supplement their own output. Stations classed as non-generating ordinarily purchase all the power they use. However, some of the latter have generating plant in the form of auxiliary-plant equipment. This results in the anomaly that, although classed as non-generating, these stations actually did generate 537,473 kwh. in 1937.

The stations are divided into two classes according to ownership, viz., (1) commercial—those privately owned and operated by companies or individuals, and (2) municipal—those owned and operated by municipal or provincial governments. The winning and utilization of raw materials at their source, characteristic of the mining, and pulp and paper industries in the Precambrian and the Cordilleran Regions, is often in the hands of large corporations that either generate their own power or purchase it from municipal stations. The Nova Scotia Power Commission, for instance, supplies energy for pulp and paper manufacture, and the Hydro-Electric Power Commission of Ontario serves the pulp and paper district of Thunder Bay and has more recently entered the mining regions of the northern and northwestern sections of the Province with developments on the English River at Lower Ear Falls and the Albany River at Rat Rapids, and with the extension of transmission lines from Nipigon River to the Little Long Lac area. Pulp and paper and mining concerns purchase a very large proportion of the output of central electric stations. Indeed, about a score of large concerns producing hydro-electric energy for sale have been developed primarily to serve pulp and paper or mining and mineral reduction operations.

<b>Totals.....</b>	<b>25,690,785</b>	<b>463,375</b>	<b>26,154,160</b>

While commercial, street lighting, and household services play subordinate roles as far as the amount of power used is concerned, the low cost of these services has been important in the development of urban centres. Public authorities have found it desirable to encourage rural electrification by government aid, and this has been done in Ontario through the Hydro-Electric Power Commission, in Manitoba through the Manitoba Power Commission, and in Quebec under recent legislation passed on the recommendation of the Lapointe Commission.

In 1938 central electric stations engaged in the public sale of energy controlled 88 p.c. of all developed water powers, as compared with 70 p.c. in 1922. The energy they supply drives 84 p.c. of the electric motors and 66 p.c. of all the power equipment used in manufacturing industries. The total amount of capital invested in central electric stations was greater than that invested in any other manufacturing industry, while in wages and salaries paid they ranked second in total value. The net value of their output in 1938 was greater than that of any other industry and in gross value they ranked second only to the pulp and paper industry. Almost the whole, or 98 p.c., of the output was hydro-electric power while 95.7 p.c. of the primary power equipment of these stations was hydraulic.

Included in the statistics of central electric stations are those of a few stations engaged primarily in other industries, such as mining, manufacturing of pulp and paper, etc., which sell surplus power. For such plants, the statistics pertaining to the central electric station phase of the industry only have been given as far as possible.

### Subsection 1.—Historical and General Statistics.

The growth of the central electric stations industry, has been almost continuous since 1919, when statistics of kilowatt hours generated were first made available. The depression that occurred in the early 1930's resulted in decreased output of power for several years but this proved to be a temporary condition and output has now recovered and is again increasing in the same manner as characterized the years immediately preceding 1930. The record amount of power generated in 1937, was over 500 p.c. greater than the amount generated in 1919 and 53 p.c. greater than 1930 figures.

The number of customers has increased each year since 1920, with the exception of 1933 and 1934 when small decreases were shown, the increase from 1920 to 1938 being over 110 p.c. Domestic service customers account for the large majority of customers and for over 80 p.c. of this increase. The domestic service consumption of electricity, however, is only around 8 p.c. of the total consumption in Canada.

The industry is one that is particularly suited to large-scale operation, because of the huge outlays of capital necessary and the length of time required to bring a large water-power project to completion. As the industry grew, stations tended to become larger in size; there are now three stations with capacities of over 500,000 h.p. and several with capacities of over 200,000 h.p. Capital invested and total horse-power installed increased each year from 1920 to 1937 even during the depression years, mainly because large power projects, planned before the depression were in process of construction during the early years of 1930.

The number of persons employed and salaries and wages paid in central electric stations decreased considerably during the depression years. Figures since 1934 show improvement in each year, however, even though at a slower rate than shown by other statistics.

## 6.—Summary Statistics of Central Electric Stations, 1917-38.

Year.	Stations.	Capital Invested.	Revenue from Sale of Power <sup>1</sup>	Total Horse-Power. <sup>2</sup>	Kilowatt Hours Generated.	Cus-tomers.	Persons Em-ployed.	Salaries and Wages.

<sup>1</sup> Excluding duplications.<sup>2</sup> Not including auxiliary plant equipment.<sup>3</sup> Data not available.

The total output of electricity generated by central electric stations in 1938 was 26,154,160,000 kwh., a decrease of 5.5 p.c. from 1937. This output was, however, only 47.0 p.c. of the rated capacity of the equipment installed. Of course, a ratio of 100 p.c. is not possible with varying loads, but the 1938 ratio showed a drop of 3.3 points from that of 1937.

Off-peak or secondary power produced for consumption in electric boilers, which, in 1938, amounted to 5,751,350,000 kwh., or 22 p.c. of the total output of power, showed a decrease of 1,561,664,000 kwh. from the 1937 figure, but an increase of 1,632,409 kwh. was shown in the off-peak and surplus power exported to the United States. Firm power increased by 26,547,000 kwh. The pulp and paper industry took 8,382,806,000 kwh., or 32 p.c. of the total output. This consisted of 4,550,660,000 kwh. of secondary power for boilers, which was 79 p.c. of the total quantity so used by all industries, and 3,832,146,000 kwh. of firm power for power and light. This was 18.6 p.c. less than the 1937 consumption by these mills.

The domestic service consumption or the electricity used in residences has also increased steadily, even during the years 1930-33, and in 1938 amounted to 2,172,500,000 kwh., an increase of 46 p.c. over the 1930 consumption and 8.2 p.c. over the 1937 consumption. The average consumption for domestic use is 67 p.c. higher in Canada than in the United States, while the total consumption for domestic or residential use is about 8.3 p.c. of the total output of central electric stations for Canada and 19.7 p.c. for the United States. This, of course, is due to the fact that the industrial area of the United States has an abundant supply of

low-priced coal while in the central provinces of Canada, with no coal but with an excellent supply of water power, conditions favour the generation of power in central stations.

**Equipment of Central Electric Stations.**—The main-plant primary power equipment of all central electric stations aggregated 7,476,976 h.p. in 1938. This included water wheels and turbines, steam reciprocating engines and turbines, and internal combustion engines. The hydraulic power machines greatly predominated over the other prime movers, providing 95.7 p.c. of the total capacity, with steam turbines, steam reciprocating engines, and internal combustion engines making up the remaining 4.3 p.c. Not included in the above were steam engines and internal combustion engines with a capacity of 195,628 h.p., or 2.6 p.c. of the total power capacity, installed as auxiliary or standby equipment. Power equipment used in mining and manufacturing industries is dealt with at pp. 387-390.

Central electric stations that have no water power, but are operated by steam and internal combustion engines, are on the whole small stations. Of the 43 main-plant steam reciprocating engines in central electric stations in 1938, only 7 in number were over 500 h.p. The steam turbines averaged approximately 4,078 h.p. with 20 units averaging 9,236 h.p., but there were only 68 steam turbines in the industry and these were confined to 29 stations, whereas the 816 water wheels and turbines averaged 8,769 h.p., including 4 at 65,000 h.p. and 5 at 66,000 h.p. each.

The majority of the fuel-using stations are primarily for lighting purposes, using the cheapest fuel procurable, generally local coal. In the Prairie Provinces bituminous and lignite coals are used for the steam engines and gasoline, oil distillates, and producer gas for the internal combustion engines.

Of the 397 main-plant internal combustion engines in central electric stations in 1938, 203 or 51 p.c., were in Saskatchewan, 74 or 19 p.c. in Alberta, and 41 or 10 p.c. in Manitoba.

During 1938, the thermal engines produced 463,375,000 kwh. at a cost for fuel of \$2,010,902, an average of 0.5 cents per kwh. This production was, however, less than 2 p.c. of the total output.

**Provincial Distribution of Electric Energy.**—In the latest year over 81 p.c. of the total generated electric energy was produced in the leading industrial Provinces of Ontario and Quebec. From Table 18 at p. 385 it will be seen that the total electric energy exported in the calendar year 1939 was 1,912,626,000 kwh., or 6.7 p.c. of the estimated production by central electric stations in that year; in 1938 it had amounted to 1,826,515,000 kwh., or 7.0 p.c. of the total amount generated in central electric stations.

**Farm Service Furnished by Central Electric Stations.**—The number of farm customers reported by publicly owned and privately owned central electric stations for 1930 was 37,887 and the number of farms with electric service as recorded in the Decennial Census of 1931 was 58,741. The census defines as farms, plots of ground of one acre or over producing agricultural products valued at \$50 or more. Many of the small farms of less than 5 acres, of which there were 19,713, were undoubtedly close to cities and towns and would not be counted as farm customers by the power companies. Also the data for individual provinces indicates that the power companies did not segregate all farm customers.

Annual data on farm service throughout Canada would provide very valuable information but, owing to the difficulties of securing comparability, reliable figures of farm service on a provincial basis for years from 1930 to 1938 are not available. The data is most reliable for Ontario and Quebec and, therefore, the statistics given in Table 9 have been limited to these two provinces. The only provinces in which the number of farm customers reported closely approached the number of farms with electric service were Ontario and Quebec for the year 1930. In Ontario in 1930 there were 24,367 farms with electric service and 19,644 farm customers reported. The Provincial Government subsidizes the construction costs of farm services of the provincial system. Consequently the record of farm customers is undoubtedly more nearly correct than in other provinces. In Quebec 17,907 farm customers were reported in 1930 compared with 14,541 farms with electric service.

When the number of farms with electric service is available from the Census of 1941, comparisons might reveal an improvement in the reporting of farm customers by the power companies, although 1938 data indicates that these customers are still classed as domestic service customers in most of the provinces.

### Subsection 2.—Public Ownership of Central Electric Stations.\*

When, in the early years of the twentieth century, it became evident that the development of hydro-electric power would become a 'key industry' in Canada, more especially in the coal-less central provinces of Ontario and Quebec, a strong movement arose, particularly in Ontario, in favour of conserving the water powers of the country for the public benefit instead of allowing them to pass into the hands of private corporations.

### 10.—Publicly Owned Central Electric Stations in Canada, 1929-38.

In Ontario the population had already been settled in relation to small water powers and steam engines before hydro-electricity became commercially important. Towns scattered in the area between Toronto and Windsor were supported by widespread agricultural and manufacturing activities. Out of their needs for power arose the agitation that led to the creation, in 1906, of the Hydro-Electric Power Commission of Ontario as an instrument to bring power to them from Niagara Falls and prevent the development of this great water-power site from building up rival industrial centres at their expense.

In Quebec public ownership has not made much headway. Perhaps one reason for this is that power development there has been closely associated with the pulp and paper industry, which, owing to its rapid development and huge demand

\*The information included under the provincial headings of this subsection (pp. 373-383) has been revised by the various Provincial commissions or authorities concerned.

for power, favoured private enterprise. Another factor is Quebec's traditionally conservative attitude towards public ownership of utilities. Quebec is in fact the stronghold of private enterprise in this field, and large corporations, such as Beauharnois; Montreal Light, Heat, and Power; Shawinigan; and Southern Canada Power, carry on large-scale operations in the Province. The development of electric energy in New Brunswick also has been largely in relation to the production of pulp and paper, and commercial companies still control a great deal of the power, although the New Brunswick Power Commission established in 1920 has since organized public utility services on the same lines as those of Ontario, providing both hydro- and steam-generated power. In Saskatchewan, and also to a considerable extent in Nova Scotia, coal and gas are the basic sources of the energy used to generate electricity, as these are regions of scarce water power and plentiful fuel supply. Nova Scotia, Saskatchewan, and Manitoba have established Hydro-Electric Commissions on the model of the Ontario system.

In British Columbia the population is concentrated on the Fraser Delta and around Victoria. As these areas of settlement have grown up along with scattered mining, sawmilling, and pulp and paper towns, hydro-electric power to serve their needs has been developed by private corporations but also to some extent by smaller public utility corporations. (See pp. 383-384).

Table 11 shows statistics of municipally or publicly owned central electric stations, by provinces, for 1938. Table 17 at p. 384 shows comparable statistics for commercial stations.

Because of the absence of free market determination of prices and regulation of services in an industry that is semi-monopolistic, regulation of electrical utilities has been attempted in most provinces. The governing bodies, their general regulations, and their activities are discussed by provinces.

**Nova Scotia.**—In 1909 legislation was first enacted in Nova Scotia relating to the use of water power in "An Act for the Further Assisting of the Gold Mining Industry". This was the most advanced legislation until the development of water power within the Province of Nova Scotia was initiated under the Acts of 1914 and carried on in an investigatory manner in co-operation with the Dominion Government until 1919, when the Nova Scotia Power Commission was created by the Power Commission Act. Although the Commission has its own Department of

Investigation, certain investigatory work is still carried on in Nova Scotia by the Dominion Government represented by a branch of the Dominion Water and Power Bureau with which the Nova Scotia Power Commission is closely associated.

The function of the Commission is, primarily, generation of electric power and energy by the most economical means available that is practically suited to the case under consideration. Its operations are carried out on a cost basis and, while a considerable number of retail customers are served, it is not the policy to compete in the retail field, but rather to serve those districts where it is not practicable to receive service from other sources. The Rural Electrification Act of 1937 greatly increased the possibilities for retail service and full advantage is being taken of this legislation by residents in various parts of the Province.

The following statement shows developments with their initial capacities:—

The progressive trend portrayed above is more strikingly emphasized by the comparison of the total delivery for the year ended Nov. 30, 1939, of 234,288,000 kwh. with the delivery of 192,000 kwh. for the first year of operation.

The Commission's developments are now operated under nine systems comprising: 1,100 miles of transmission and distribution lines serving 22 wholesale and 3,300 retail customers; 16 generating stations and 34 generating units, with a total installed capacity of 76,200 h.p. The *Antigonish System* is non-generating and is supplied by the *Sheet Harbour System*, but will become a generating system when Barrie Brook Development goes into operation. It serves the town of Antigonish and other places in Antigonish and Guysborough Counties. The *Canseau System* is made up of a number of distribution districts throughout the Island of Cape Breton and is served by diesel-electric units except in Mabou District for which energy is purchased from the Inverness Collieries. The Districts in operation are St. Peter's, Cheticamp, Mabou, Port Hawkesbury, Isle Madame, Grand Anse, Whyecocomagh, Judique, and Margaree. A submarine cable connects the Antigonish and Canseau Systems for interchange of energy. The *Markland System* is non-generating and is supplied by the *Mersey System* from its Cowie Falls Development. It serves the Town of Liverpool, the Caledonia Valley and places in vicinity, and supplies power for a woodworking factory. The *Mersey System* supplies the demands of a pulp and paper mill at Brooklyn, Queens County. The *Mushamush System* sells power wholesale and retail in Lunenburg County. The *Roseway*

\* Discontinued, October, 1938.

† Distribution system only.

*System* sells power wholesale to the Town of Shelburne and wholesale and retail to the Town of Lockeport and vicinity, and along the shore to Port Clyde and vicinity. The *Sheet Harbour System* supplies Antigonish System and the Town of Truro through the Pictou County Power Board, to which it sells power wholesale. It supplies the demands of a groundwood pulp mill at Sheet Harbour, and retails in Sheet Harbour and in Musquodoboit and Stewiacke Valleys. The *St. Margaret System* sells power wholesale and retail in Halifax and vicinity including the Districts of Hammond Plains, Prospect, Seabright, Beechville, Five Island Lake, Peggy's Cove, and Lewis Lake. The *Tusket System* sells wholesale in Yarmouth and supplies the demands of the Cosmos Imperial Mills, Limited, at Yarmouth.

The control of the water resources of the Province is vested in the Crown and administered by the Nova Scotia Water Act. The Commission pays the regular fees for water rights in the same proportion as do others who enjoy these privileges.

Financially the Commission is self-supporting, repaying its own borrowings, an item of cost, from revenue. The Commission in the past has borrowed from the Government for capital investment but is empowered to issue bonds and debentures guaranteed by Governor in Council and commenced that policy late in 1938 with an initial \$1,000,000 issue of serial debentures.

The balance sheet at Nov. 30, 1939, showed: fixed assets of \$16,087,305; work in progress, \$263,375; current assets, \$205,442; contingency and renewal reserves, \$995,993; sinking fund reserves, \$1,930,587. The total accumulated reserves amounted to \$3,032,381.

**New Brunswick.**—The New Brunswick Electric Power Commission was incorporated under the Electric Power Act, 1920. The Commission owns and operates the following generating stations:—

Plant.	Type.	Capacity.
		h.p.
Musquash.....	Water power.....	11,000
Grand Lake.....	Steam.....	15,000
Kouchibouguac.....	Water power.....	200
Grand Manan.....	Diesel.....	200
St. Quentin.....	Diesel.....	65
Total.....		26,465

The Commission also purchases power to serve the Village of Port Elgin and the adjacent rural district. Power for the rural district east and west of Dalhousie is secured from the Gatineau Power Company at Dalhousie.

The Musquash, Grand Lake, and Kouchibouguac plants are interconnected and operate in parallel at all times.

**Transmission Lines.**—The transmission system consists of a 66,000-volt line from Musquash to Moncton; and four lines from Grand Lake, viz., two 33,000-volt lines to Fredericton, one 66,000-volt line to Newcastle, and one 66,000-volt line to Moncton. In addition to the above lines, the Commission has built 12 miles of 66,000-volt line from Grand Lake to Coles Island. It is planned to continue this line to Saint John to take care of the growing load in that district.

Power is sold *en bloc* to the Cities of Saint John, Moncton, Fredericton, and the Town of Sussex. Power is also distributed directly by the Commission in every county of the Province to various towns, villages, and rural communities.

The statistical information given below shows the growth of the Commission's undertaking since the beginning of operation.

**Quebec.—Quebec Streams Commission.**—Created in 1910 by 1 Geo. V, c. 5, and given additional powers by 3 Geo. V, c. 6 (see R.S.Q., 1925, c. 46), and by 20 Geo. V, c. 34, the Commission is authorized to ascertain the water resources of the Province, to make recommendations regarding their control, and to construct certain storage dams and operate them so as to regulate the flow of streams. The Commission has not undertaken the direct production of electric power, but has assisted companies engaged in such work by a systematic collection of data on the flow of the principal rivers and on the meteorological conditions, by investigation of numerous water-power sites and determination of the longitudinal profile of a large number of rivers, but mostly by the regulation of the flow of the principal power streams, thereby increasing very materially the amount of power available. This regulation is obtained by constructing storage dams that hold water in large reservoirs during flood periods and enable it to be used to increase the flow at low-water periods.

From 1912 to 1925, storage reservoirs were built or acquired and operated by the Commission, charges being made to benefiting companies covering interest and amortization on the capital invested as well as the cost of operation. Since 1925, companies or persons have availed themselves of the latitude given them by R.S.Q. 1925, s. 6, c. 46, to build the necessary dams for impounding water in reservoirs, subject, however, to rules and conditions laid down by the Lieutenant-Governor in Council. Such storages built since then have been transferred to and operated by the Commission, the cost of operation being charged annually to the interested companies or persons.

There were, in 1939, eighteen storage reservoirs in the Province of Quebec. The power development on the St. Maurice River amounted to 680,000 h.p., this total being made possible by its system of reservoirs. It is estimated that a further development of 350,000 h.p. is possible on this river. The flow of the St. Francis River is regulated by two storage reservoirs, one at Lake St. Francis and the other at Lake Aylmer. Water-power developments on this river amounted to 100,000 h.p., and further possible developments are 50,000 h.p. The Kenogami Reservoir is in the Lake St. John district and is drained into the Saguenay River through Au Sable and Chicoutimi Rivers. Water-power developments on the Chicoutimi River amounted to 41,400 h.p. and a further development of 14,300 h.p. is possible. On Au Sable River, 33,200 h.p. was installed with a further development of 2,000 h.p. in reserve.

Among storage reservoirs not controlled by the Commission are the Lake St. John Reservoir, with a huge drainage area of 30,000 square miles, and the Onatchiway Reservoir on the Shipshaw River. Power developments on the Saguenay River,

which benefit from the Lake St. John storage, amounted in 1939 to 710,000 h.p. and the development at Chute-à-Caron is capable of a further development of 540,000 h.p.

The Gatineau River flow is regulated by two reservoirs. Installed water power on this river amounted in 1939 to 470,000 h.p. and it is estimated that an additional 160,000 h.p. could be developed. On the Lièvre River water power installed amounted to 274,000 h.p. With more storage reservoirs to supplement the one now in operation, a much greater installation would be warranted.

Other storage reservoirs operated by the Commission are the Lake Mitis Reservoir, the Savane River Reservoir, and three small reservoirs on North River.

*Provincial Electricity Board.*—Created by an Act passed at the 1937 session of the Legislature (1 Geo. VI, c. 25), the Provincial Electricity Board superseded the former Quebec Electricity Commission, which operated from Dec. 2, 1935, to Aug. 31, 1937. The new Board is given power to control undertakings for the production, sale, and distribution of electricity in the Province, to fully investigate the property and accounts of such undertakings, to alter and cancel abusive contracts, and to fix rates for the sale of electricity based upon the value of physical assets and reasonable expenses of an undertaking. All electrical undertakings in the Province are to operate under licence from the Board. The duration of all contracts for the distribution of electricity is limited to five years. The Act does not apply to municipal corporations that have established an electricity service, except that such corporations may benefit by the provisions for obtaining revision of an abusive contract.

*National Electricity Syndicate.*—Created by an Act of the 1937 Legislature (1 Geo. VI, c. 24), the Syndicate is intended to develop electricity-generating plants and distributing systems in the Province. The Syndicate may establish its undertakings by one or both of two methods: first, by funds advanced by the Provincial Government; secondly, by the issue of stock or debentures of which the Provincial Government is to purchase at least 60 p.c. to give it a controlling interest. The Act authorizes the Syndicate to use the first method to develop generating plants and distributing systems in the electoral districts of Abitibi, Timiskaming, Lake St. John, and Roberval, and for this purpose authorizes an advance to the Syndicate of \$10,000,000, which may be subsequently increased by the Legislature. No further alienation or extension of leases previously granted on water-power sites of over 300 h.p., capacity may be granted without consent of the Legislature. The Act also permits the Government to contribute up to 55 p.c. of the cost of an electricity distributing system established by any rural municipality.

*Ontario.*—*The Hydro-Electric Power Commission.*—The publicly owned hydro-electrical undertaking of Ontario—known in the Province as the “Hydro”—is an organization of a large number of partner-municipalities, co-ordinated into groups or systems for securing common action with respect to power supplies. It had its beginning in 1903, when, as a result of public agitation to ensure the provision of adequate supplies of electric power for distribution throughout the Province at low cost, seven municipalities united under statutory authority in appointing an investigating commission to deal with power problems. This commission, known as the Ontario Power Commission, completed its work in 1906, and in the same year the Ontario Government, by special Act, created the present Hydro-Electric Power Commission of Ontario. The operations of the undertaking have grown rapidly and in 1938 electrical service was supplied by

the Commission to about 821 municipalities, comprising nearly all of the cities and towns of the Province, as well as many small communities and rural areas.

The providing of the power, either by generation or purchase, its transformation, transmission, and delivery to the individual municipalities and to large industrial consumers, and the operation of rural power districts are carried on by the municipalities acting *collectively* through their agent and trustee, the Hydro-Electric Power Commission of Ontario. The local operations involved in the retail distribution of the electric energy to the consumers within the limits of the various urban municipalities are performed by the municipalities *individually* through municipal utility commissions acting under the general supervision of the Hydro-Electric Power Commission.

Capital required for plant to generate and transmit power is lent by the Province, and the municipalities are under contract to repay, over a period of 40 years, the moneys thus lent, with interest in full. The local distribution systems are financed individually by the issue of municipal debentures. Provision is made, in the rates charged to the ultimate consumers, for revenue with which to retire these bonds in from 20 to 30 years. The rates at which power is supplied by the Commission to the various municipalities vary with the amounts of power used, the distances from the sources of supply, and other factors. The basic principle underlying the operations of the undertaking is the provision of service 'at cost'. The rates charged by the municipal utilities for retail service are under the control of the Commission and are designed to ensure that each class of consumer bears its appropriate share of the expenses of the undertaking. Each type of consumer is charged with the cost of the service received as far as is practicable.

*Power Supplies.*—To meet the constantly expanding power demands of the undertaking, the Commission has constructed its own generating plants, and has acquired several privately owned generating plants. Of the 45 hydro-electric power plants operated by the Commission in 1938, the largest is the Queenston-Chippawa development on the Niagara River, which was constructed by the Commission and has a normal operating capacity of 500,000 h.p. Provision for the needs of the near future has been made—including existing plants, plants under construction, and power under contract for present and future delivery—up to an aggregate of about 2,350,000 h.p.

*Hydro-Electric Power Commission Statistics.*—The Canada Year Book of 1910 (p. xliii) described the turning on, at Berlin (now Kitchener), Ontario, on Oct. 11, 1910, of electric energy generated by Niagara Falls. The small initial load of less than 1,000 h.p. increased rapidly and by 1915 had reached 100,000 h.p. In 1920 the total power distributed exceeded 350,000 h.p., and in 1930 it was over 1,260,000 h.p.

The Annual Reports of the Commission present in great detail descriptions and statistics of operation, construction, municipal work, and transmission and distribution. The Commission exercises supervisory functions over the electrical utilities owned and operated by the partner-municipalities and has introduced a uniform accounting system that enables the Commission to present consolidated balance sheets and operation reports. These statistics relate to about 90 p.c. of the retail customers supplied by the undertaking.

The initial capital expenditure required to serve about twelve municipalities amounted to approximately \$3,600,000. At Oct. 31, 1938, the total capital investment amounted to \$436,821,576, of which \$314,768,081 were investments by the Commission in generation plants, transmission systems, etc., including electric railway and other properties operated by the Commission for the major systems

under their control and \$122,053,495 were investments by municipalities in local distributing systems of their own, including other assets. Similarly, total reserves of the Commission and of the municipal electrical utilities for sinking fund, renewals, contingencies, and insurance purposes amounted to \$200,103,382 of which \$114,601,575 represented reserves of the Commission and \$85,501,807 of the municipalities.

<sup>1</sup> Not in operation.

*Statistics of Urban Municipal Electrical Utilities of Ontario Supplied by the Commission.*—Statistics of the assets and liabilities of the electrical departments of urban municipalities served by the Hydro-Electric Power Commission show, for 1938, total assets of \$166,327,665, as compared with liabilities of \$36,551,689. Of the difference, \$69,652,380 was allotted as reserves, leaving a surplus of \$60,123,596. In computing the percentage of net debt to total assets, the equity in Hydro systems is not taken into account. Between 1933 and 1938 total assets increased by \$30,548,995, while total liabilities decreased by \$13,369,065.

*Rural Electrical Service in Ontario.\**—During the past few years substantial progress has been made in Ontario in the field of rural electrification, and the Commission's rural operations are now an important feature of its work. Towards this rural work the Ontario Government, pursuant to its policy of promoting the basic industry of agriculture, contributes, in the form of 'grants-in-aid', 50 p.c. of the initial capital cost of distribution lines and equipment. In 1930 the Ontario Government passed legislation providing for advances up to \$1,000 to actual farm owners of lands and premises in rural power districts for the installation of electrical wiring and the purchase of equipment and providing for the fixing of low maximum service charges for all classes of rural service.

**15.—Statistics Relating to Electrical Service to Rural Power Districts Operated by the Ontario Hydro-Electric Power Commission, Years Ended Oct. 31, 1934-38.**

<sup>1</sup> Included in "Capital invested".

**Manitoba.**—The Manitoba Power Commission commenced its operations in 1919 under the authority of the Electrical Power Transmission Act. This Act empowered the Commission to make provision for generating electric energy, to enter into contracts for the purchase of power in bulk from generating agencies, and for its transmission and sale to municipalities, corporations, and individuals. Legislation was passed in 1929 by which the Government undertook to pay interest charges and sinking fund charges on an amount not exceeding 50 p.c. of the capital cost of the construction and erection of equipment required for the generation and transmission of electric energy. In 1931 passage of the Electrical Power Transmission Act reorganized the administration of the Commission by establishing a Board vested with additional authority.

The first transmission line was completed in 1920 to serve the City of Portage la Prairie. With this City as a nucleus, the lines were rapidly extended over the more densely populated areas of the Province. The Commission now serves 141

\* Legislation passed concerning rural power is as follows: *The Power Commission Act* (R.S.O., 1927, c. 57); *The Rural Hydro-Electric Distribution Act* (R.S.O., 1927, c. 59); *The Rural Power District Loans Act*, 1930 (20 Geo. V, c. 14); and *The Rural District Service Charge Act*, 1930 (20 Geo. V, c. 15).

cities, towns, and villages. Power has also been brought to about 500 farm homes. The Commission operates 1,768 circuit miles of transmission line, serving close to 17,000 customers. As the system expands, the demand for hydro-service becomes more insistent. In 1939, the Commission spent \$557,000 on new construction, adding 212 miles of transmission line and 23 towns to the network.

Power is at present purchased from the Winnipeg Electric Company at a substation in Fort Garry, a suburb of Winnipeg. This is the source of power for the towns on the main network. Energy is also purchased from the municipally owned plant at Dauphin and distributed to Grandview and Gilbert Plains. The summer-resort area along Lake Winnipeg is served by the Commission with power purchased from the Winnipeg Electric Company at Selkirk, and the same company furnishes the source of power for East Selkirk, Seven Sisters Falls, and St. Boniface, from which points it is distributed by the Commission to outlying districts. In 1936, arrangements were completed for the export of a block of power to the Interstate Power Company at Neche, North Dakota.

The capital invested in the Province by the Commission is approximately \$6,000,000. At the close of the fiscal year 1938 the reserves, as represented by first-class securities, amounted to \$1,808,500. The Commission is in an excellent financial position.

The system is supervised and maintained by 35 District Supervisors, located throughout the territory served. Appliance showrooms are established at Brandon and Portage La Prairie, and the Commission enters actively into the appliance merchandising field. It also operates a central steam-heating system in Brandon, and a gas plant in the same city.

The results of sales and educational policies, together with the economies enforced, are demonstrated by the fact that, while consumption in the towns receiving service in 1933 has increased by 107 p.c., the cost to the consumer of this additional service has increased by only 52 p.c. The trend of the Commission's rates has been steadily downward.

**Saskatchewan.**—The Saskatchewan Power Commission was established in 1929 under the Power Commission Act (R.S.S., 1930, c. 30), authorizing the Commission to manufacture, sell, and supply electric energy, to acquire and develop water-power sites, to acquire or construct steam and oil plants, to construct transmission lines, to purchase power, and to enter into contracts with municipalities for the supply of energy. The Commission is also given certain control and regulatory powers *re* the operation of electrical public utilities, and is charged with the responsibility for the administration of the Electrical Inspection and Licensing Act, 1935 (1934-35, c. 64).

The initial operations of the Commission were concerned with acquiring, by purchase, municipally owned plants which were improved, enlarged, or supplemented by installations made by the Commission and were operated as individual systems of supply. Examples of such acquisitions made in 1929 were the Saskatoon, Humboldt, and Rosthern plants, while the plant at Shellbrook, the Wynyard-Elfros-Wadena and the Leader-Prelate-Sceptre systems, served from plants at Wynyard and Leader, were established by the Commission in the same year. In 1930 the municipal plants at North Battleford, Swift Current, Unity, and Lanigan, and the privately owned plant of the Maple Creek Light, Power and Milling Co. at Maple Creek were acquired, and in 1931 the generating plant at Willow Bunch was

added. The Watrous-Nokomis system, including two generating plants, a transmission line, and local distribution systems in ten towns and villages, was also purchased from Canadian Utilities, Limited, and has been connected with the Bulyea System of the Montreal Engineering Co., Limited.

Transmission lines run from Saskatoon, as the centre of the Commission's main system, easterly to Humboldt, northerly to Shellbrook and Duck Lake, westerly to Radisson, and southwesterly to Rosetown. Additional lines link Rosetown with Moose Jaw, and Tisdale (where the Commission has a generating plant) with Nipawin. The systems built in 1929 have been extended. All transmission lines supply towns and villages along their courses. By a line built in 1935, service is given to the Town of Battleford from the North Battleford plant. At the beginning of 1937 the Commission acquired, by purchase, the municipal plant and distribution system formerly owned by the Town of Canora, and installed a new generating unit. Towards the end of the same year 25 miles of transmission line were added to the Tisdale system to serve Arborfield, Aylsham, and Zenon Park, and this system has since been extended to serve White Fox. The Watrous-Nokomis system was, in the year 1938, extended to Lockwood and Drake, and to Lanigan, where the Commission had previously operated a local plant. In 1938, also, an extension was made to the Commission's Saskatoon-Moose Jaw system by the construction of 12 miles of line from the neighbourhood of Riverhurst to a pumping station established by the City of Moose Jaw on the Saskatchewan River. There were, in 1939, 1,430 miles of transmission lines owned and operated.

Of the 15 generating plants owned and operated by the Commission in 1939, those in the Cities of Saskatoon and North Battleford were steam plants and the remainder were equipped with compression ignition engines. The total installed capacity of the generating plants was 29,400 kw. There were no hydro-electric plants in the Commission's system the primary power being: steam reciprocating engines 750 h.p.; steam turbines, 30,800 h.p.; and internal combustion engines, 6,750 h.p.

The Commission purchases several blocks of power or contracts for the interchange of power from private interests in addition to supplying energy generated at its own plants. In the year 1938 the total quantity of power purchased from private interests was 1,955,000 kwh. while in the same year the total quantity of power generated at Commission plants was 49,435,000 kwh. The number of consumers served directly in 129 towns and villages was approximately 9,467 and those indirectly served (in the Cities of Saskatoon, North Battleford, and Swift Current, and the Town of Battleford, where the municipal corporations themselves own and operate the distribution systems) numbered 13,606. The total revenue for the calendar year 1938 was \$1,173,620. Provision has been made for depreciation and replacement reserve (including certain municipal debentures assumed and since redeemed) to the amount of \$2,127,370. The total plant investment as at Dec. 31, 1938, was approximately \$7,765,571.

During 1939, the considerable improvement in general economic conditions was reflected in the business of the Commission.

**Alberta.**—In this Province the Board of Public Utility Commissioners regulates both hydro-electric and steam-plant companies. The Board has general jurisdiction over rates charged by any public utility, i.e., any system of works, plant, or equip-

ment for the production, transmission, delivery, or furnishing of heat, light, or power. It has no control over any municipal corporation that owns its own power plant, unless the municipality passes a by-law bringing it under the Act.

The Board has power to hold investigations upon complaint that rates are unfair made either by a municipality or a public utility, and may fix just and reasonable rates according to the evidence disclosed. There are only two major companies operating in this Province: the Calgary Power Company Limited and Canadian Utilities Limited. There are a large number of smaller companies serving various towns and villages and a number of municipalities operating their own plants.

**British Columbia.**—Public ownership of hydro-electric power in the Province of British Columbia is confined to municipal organizations and commercial enterprise, no power commission similar to those in operation in other provinces having been established.

The Public Utility Commission, created under the provisions of an Act of the Legislature in 1938, regulates the rates that are charged by the privately owned utilities but not those owned by municipal incorporations.

### Subsection 3.—Private Ownership of Central Electric Stations.

Of the total amount of electricity generated in Canada by central electric stations, privately owned or commercial stations generated 19,488,323,000 kwh. or 74.5 p.c. in 1938. In 1929 the amount generated by these stations was 71.0 p.c. of the total. In the same period, horse-power installation increased by 44.4 p.c. and output of electric energy by 52.6 p.c.

1938.....	406	859,506	19,488,323	5,142,432	5,300,183

The predominant position of Quebec in the electric-power field can be seen from the column in Table 17 showing electric energy generated. Of the total power generated in Canada by central electric stations 52.2 p.c. was generated by privately owned or commercial stations in the Province of Quebec. Practically all of this amount was hydro-power and Quebec generated 70 p.c. of the total hydro-power generated by central electric stations, demonstrating the tremendous influence that the water-power resources of this Province exert on the industry in Canada. In

comparison, total power generated in Ontario by both privately owned and municipally owned stations was only about 28.8 p.c. of the total power generated by central electric stations in Canada.

There are two important factors in this large production of hydro-electric power in Quebec: (1) the pulp and paper mills located close to both the water power and the supply of pulpwood, which take around 40 p.c. of the Quebec hydro-electric power; and (2) the industries in eastern Ontario that import around 18 p.c. of the Quebec output of power.

Of the total power generated by central electric stations in each province, privately owned or commercial stations generated the following percentages in 1938: P.E.I., 85; N.S., 42; N.B., 87; Que., 99; Ont., 27; Man., 65; Sask., 31; Alta., 62; and B.C., 99.

In Quebec, Ontario, Manitoba, and British Columbia power produced by these companies was almost entirely hydro-electric. Power generation in Saskatchewan was entirely by fuel plants, and in Nova Scotia about 31 p.c. was generated by fuel.

#### Subsection 4.—Export of Electric Power.

The export of electric energy is regulated by the Electricity and Fluid Exportation Act, 1907 (6-7 Edw. VII, c. 16). This Act was administered by the Department of Inland Revenue until Sept. 1, 1918, when, by Order in Council of June 3, 1918, its administration was transferred to the Department of Trade and Commerce. (See cc. 54 and 55, R.S.C., 1927.)

A licence to export power must be secured from the Electricity and Gas Inspection Services of the Department of Trade and Commerce. This branch of the Department also has jurisdiction over the export duty which has been imposed since Apr. 1, 1925. During the fiscal year ended Mar. 31, 1939, the export duty amounted to \$449,987 as against \$430,544 for the previous year. The rate is 0.03 cents per kwh. on electric energy exported with certain exports excepted. Table 18 shows the quantities of energy actually exported during the calendar years 1936 to 1939. The data for this table were compiled from the reports of the Director of the Electricity and Gas Inspection Services.

<sup>1</sup> Exported by Canadian Cottons, Ltd., from April, 1937.

Export trade figures by fiscal years show that export of power to the United States reached a low point in 1933, with 647,742,000 kwh. but about the middle of that year exports increased and have continued to increase each year with the exception of 1938, being 1,912,626,000 kwh. for 1939. Of this amount, Ontario supplied 67.5 p.c., Quebec 31.2 p.c., and New Brunswick 1.3 p.c. Manitoba and British Columbia also exported small amounts, some of the latter going to Alaska.

A small amount of power, 3,655,793 kwh. valued at \$61,442, was imported from the United States in the fiscal year 1939. Ontario took over 63.0 p.c. of this power and the remainder was divided among the Provinces of New Brunswick, Quebec, Manitoba, Saskatchewan, and Alberta.

In the calendar year 1938, central electric stations in Quebec exported 2,815,051,659 kwh. to other provinces; an important feature was the production of power by commercial stations in Quebec for public stations in Ontario. Of the total, Ontario took 2,809,117,059 kwh., 596,526,022 of which was for re-export to United States, and New Brunswick took the remainder. British Columbia also exported a small quantity, 2,395,382 kwh., to Alberta.

### Section 3.—Evolution of Power Equipment and Utilization of Power in Industry.

Power equipment installed in industrial establishments is a very good barometer of the industrial development of Canada, inasmuch as production is increasingly dependent on power equipment. Increases and decreases in productive capacity, measured in horse-power, are not the result of temporary fluctuations in costs and values in the same manner as capital investments, values of products, etc. Of course, power equipment installed is not a measure of the actual utilization of power for there is generally an excess over actual requirements, i.e., over power equipment in operation. Producers must have a working operating margin in excess of normal requirements to provide for booming business conditions or breakdown of part of the plant; in times of depression this margin increases. Then, too, the practice in factories, etc., of installing individual motors to each machine in place of large central motors increases total installed capacity. If spare or idle machinery could be deducted from total installation over a long period of time, the resultant data would be more informative. Reports of such spare or idle equipment are available, however, only since 1934, and for the three years 1935, 1936, and 1937 the percentage

of equipment not in regular use has been approximately the same each year, viz., slightly under 6 p.c. Power equipment figures, unless such deductions can be made over a long term, will not reflect temporary depressions.

Complete data for a survey of the actual consumption of power in industry, therefore, are not available at present. Also it is not possible to give figures of power equipment installed in agriculture, forest operations, fisheries, etc., in so far as these refer to primary operations, although data are available for mining, where power is used in substantial amount—especially electric power (for mining industries are even more highly electrified than manufacturing industries). However, since secondary products made from the raw materials of agricultural, forest, and fisheries production are covered in secondary stages of processing as “manufactures”, and because in the primary operations of agriculture, fishing, and the forests power equipment is not employed on a very extensive scale, the growth in aggregate power equipment of the manufacturing and mining industries may be accepted as fairly representative of the entire industrial field.

Electric motors in the manufacturing and mining industries operated by purchased power are included with primary power equipment and consequently the central electric stations producing the power are not included as manufacturing industries. Electric motors operated by power generated within these industries are not included in Table 20 with the primary power equipment that produces the power to operate them but they are shown separately, together with the total of all electric motors for each year. These totals indicate the rate of growth of electric drive in these industries in Canada, which has increased from 60·8 p.c. of the total power equipment in 1923 to 79·3 p.c. in 1937.

Analysis of all the data shows that there has been a general and decided evolution of power machinery towards electric drive, especially by electricity purchased from central electric stations, even discounting exaggeration of the movement owing to the practice referred to at p. 385 in certain establishments of installing motors at each machine or group of machines, which requires a total horse-power installation greater than would be necessary if only one large unit were used.

The ratio of electric rating of motors, operated by power generated in the industry and purchased power, to total power equipment shows the evolution of power equipment towards electric drive in general and particularly towards electric motors driven by power generated in central stations.

#### 19.—Percentages of Electric Rating to Total Power Equipment in the Manufacturing and Mining Industries, 1923-37.<sup>1</sup>

NOTE.—Figures exclude central electric stations and include idle and reserve equipment.

Year.	Total Power Equipment Installed.	Electric Power.	
		Total Motor Capacity.	Per cent of Total.
	<b>h.p.</b>	<b>h.p.</b>	<b>p.c.</b>
1923	2,448,219	1,488,523	60·8
1924	2,833,240	1,844,781	65·1
1925	3,201,250	2,187,827	68·3

1927	3,657,815	2,571,070	70·3
1928	3,999,864	2,882,048	72·1
1929	4,305,909	3,196,804	74·2
1930	4,548,014	3,376,103	74·2
1931	4,620,570	3,510,779	76·0
1932	4,625,002	3,559,516	77·0
1933	4,722,942	3,576,793	75·7
1934	4,850,743	3,781,779	78·0
1935	5,019,958	3,889,366	77·5
1936	5,186,506	4,059,355	78·3
1937	5,562,772	4,411,974	79·3

Of the total increase in power equipment employed in all manufacturing and mining industries since 1923, amounting to 3,114,553 h.p., or 127 p.c., approximately 85 p.c. was in electric motors operated on power purchased from central electric stations. Hydraulic turbines and water wheels accounted for about 2 p.c. of the increase but because central electric power is 98 p.c. hydro-electric, it is fair to state that about 85 p.c. of the increase was direct hydraulic or hydro-electric drive. However, some sections of Canada are not so well provided with water power and in such sections primary power derived from steam engines or turbines, and internal combustion engines—which include all gasoline engines, gas engines (natural, coal, and producer gas), and compression-ignition engines—has also increased rapidly during the period covered. In 1937, as will be seen from the table on p. 390, the percentage of all power equipment installed under these headings was 20·9, most of which was steam engines and turbines. Hydraulic turbines and water wheels reached 12·6 p.c., and electric motors operated by purchased power 66·6 p.c. During the period 1923-37 there has been very little net increase in the use of water wheels; steam engines increased in capacity in the same period by about 39 p.c.; internal combustion engines more than doubled; but the capacity of electric motors has about trebled.

In the Provinces of Prince Edward Island, Nova Scotia, New Brunswick, Saskatchewan, and Alberta, primary power produced from fuels is an important factor.

Of the total power equipment installed in the manufacturing industries in 1937 (first part of Table 20), it will be seen that approximately 51 p.c. is used in the manufacture of wood and paper products; the next group in importance is iron and its products, which accounts for a little over 15 p.c.; non-ferrous metal products is third with 10 p.c. Together, these three groups account for 76·6 p.c. of such installation.

The electric power employed in the pulp and paper industry is far greater than that consumed in any other individual industry, constituting 35 p.c. of the total for all manufacturing industries in 1933 and 38 p.c. in 1937, and the growth in electric drive for this industry—from 447,847 h.p. to 1,520,534 h.p.—over the same period has been an important factor in the increase as a whole.

Of the equipment installed in mining industries, nearly 62 p.c. is used in metal mining and almost 33 p.c. in non-metal mining.

**Power Used in Industries.**—Central electric stations, with 7,539,435 h.p. of primary equipment and 6,374,304 kva. of dynamo capacity, produced 27,687,645,000 kwh. in 1937. This was about 50 p.c. of the industry's capacity working 24 hours per day for 365 days. Very few industries work on a 24-hour, 7-day week basis; also few industries can utilize their power equipment as efficiently as central electric stations. Further, power used in any form except as electricity is not measured and consequently a measure of the mechanical power used in industries is not possible other than the capacity of the equipment. If other forms of mechanical power used in industries were measured in the same manner as electric power, the total quantity could be computed. It is not feasible from data available to convert the kilowatt hours and fuel consumed because large quantities of electric power are used to heat water, smelt metals, decompose water, and for other electric chemical purposes; also the thermal values of fuels and efficiencies of boilers and engines differ widely.

### Section 4.—Power Generated from Fuel.

**Industrial Use of Fuel.**—Fuel is used quite generally throughout the industrial field for the generation of power by means of steam and internal combustion engines. It is also used for the heating of plants, and for providing the heat necessary

to some manufacturing processes. The most important industries where heat is applied to materials to facilitate or accomplish a desired transformation are: foundries and machine shops; brick, tile, lime, and cement works; petroleum refineries; the glass industry; distilleries; food preparation plants; rubber goods industry; etc. Fuel used for such heating purposes, as well as for power, is included in the figures of Table 21. The figures of the table do not include fuels that constitute the raw materials to be transformed as coal in the coke and gas industries, and crude petroleum in the refining industry. Electricity used in metallurgical processes as in the electrolytic refining of non-ferrous metals is also excluded.

The value of fuel consumed in the manufacturing and mining industries in 1937 showed an increase of 32 p.c. over 1936. Of the 1937 fuel account, the requirements of Ontario cost slightly over 50 p.c. of the total, Quebec's 24.7 p.c., British Columbia's 7.6 p.c., and Nova Scotia's 6.6 p.c.

The wood and paper products group used 21.2 p.c. of the fuel consumed by manufacturing industries, non-metallic mineral products 19.0 p.c., and iron and its products 17.6 p.c.

<sup>1</sup> In the mining industries the figures for gasoline and kerosene are included with fuel oils from 1922 to 1926 and with other fuel from 1927 to 1937; in the manufacturing industries gasoline and kerosene are included with other fuel for the whole period. <sup>2</sup> Not including fuel used in metallurgical operations; prior to 1928 the fuel used in these operations was relatively small.

**21.—Fuel Used in the Manufacturing and Mining Industries of Canada, 1922-35, with Details by Provinces and Industrial Groups, 1936 and 1937—concluded.**

This chapter deals with manufacturing industries in Canada in two main Parts. Part I gives general analyses of manufactures in the Dominion and Part II deals with the provincial and local distribution of manufacturing production.

With regard to the first section of Part I, dealing with historical development, it has been impossible to compile absolutely comparable statistics over a long period of years. From 1870 to 1915 statistics were collected only in connection with decennial or quinquennial censuses, and there was inevitably some variation in the information collected. The annual Census of Manufactures was instituted in 1917 and, while numerous changes have been made since then in the information collected and the treatment of the data, an effort has been made in the present edition to carry all major revisions, in so far as possible, back to 1917, so that the figures for the period since then are on a reasonably comparable basis.

**The Evolution of Canadian Manufacturing Industries.**—The type of manufactures established in a community will, in the beginning, be determined largely by the raw materials available in that community, more especially where transportation charges are high. For example, the first agricultural process to be carried on by Europeans in what is now the Dominion of Canada was probably the raising of a crop of grain at Port Royal, Nova Scotia, in 1605; the first corresponding manufacturing process was the grinding of the grain in the autumn of that year. Other early manufactures were necessarily connected with the satisfaction of the primary needs of human beings for food, clothing, and shelter, and with the other primary need—protection.

Since the earliest settlements, two main influences have been operating upon the development of manufacturing in Canada: first, the domestic requirements of the growing Canadian population; and secondly, the processing of natural products of Canada to change them to more suitable forms for export. The comparatively small home market, a large part of it in scattered agricultural areas, has always limited the range of goods that may be economically manufactured in Canada for that market. As the Canadian population increases and as the means of distribution improve, the range of goods that may be efficiently manufactured for the home market is being constantly widened, although, as the general standard of living in

Canada rises, the variety of fabricated goods for which there is an effective demand within the country is continually expanding, so that there will always be a place in the Canadian market for imports of highly fabricated goods.

A striking modern feature of manufacture for the home market is the importation of raw materials not indigenous to Canada for the production of goods for which there is a large domestic market. Typical examples are the cotton textile and the rubber goods industries. Furthermore, a large iron and steel industry has grown up in Nova Scotia, Quebec, and Ontario, dependent upon imported iron ore from Newfoundland and the United States.

From the beginning, important manufacturing operations in Canada have been associated with the preparation of natural products for export. Early examples were the curing of fish and furs and the preparation of forest products. In the days of wooden ships, shipbuilding was an important industry along the St. Lawrence and in the Maritime Provinces. Similarly, under modern conditions, the largest industries are mainly based upon the country's natural resources in agriculture, forests, and minerals, while cheap water power is an important factor in the ability of these great manufactures to compete successfully in world markets.

Under modern conditions the major part of Canada's exports of natural products have undergone some manufacturing process before being shipped abroad. Typical examples are: wheat flour, dairy products, and dressed meats arising from the agricultural resources; lumber, shingles, and pulp and paper from the forests; refined metals from the mines; and cured and canned fish from the Atlantic and Pacific fisheries. The proportions of manufactured goods among Canadian exports are given in the "Condensed Preliminary Report on the Trade of Canada, 1938-39", pp. 37-43, and in the External Trade chapter of this volume (see Index).

## PART I.—GENERAL ANALYSES OF MANUFACTURING IN THE DOMINION.

### Section 1.—Historical Summary Statistics, and Indexes of Value and Volume.

This Section gives a picture of the growth of manufacturing in general as shown by comparable principal statistics, i.e., establishments, capital, employees, salaries and wages paid, cost of materials, and values of products. Other useful comparisons are made in Table 4 and figures of consumption are given in Table 5. Tables 6 and 7 show volume comparisons.

#### Subsection 1.—Growth of Manufacturing in Canada since 1870.

##### Growth of Canadian Manufactures Prior to the War of 1914-18.—

Until the later '90's, the growth of Canadian manufacturing industries was not particularly rapid, though the great fall in the prices of commodities during the period from 1873 to 1897 was largely responsible for the comparatively slow growth of the gross values of manufactured commodities from \$221,600,000 in 1870 to \$469,800,000 in 1890, as shown in Table 1. Afterwards there was a change and the prices of commodities commenced to rise, while the industries generally shared in the advantages of the great growing period from 1900 to 1912. The gross product of establishments with five hands or over increased from \$368,700,000 in 1890 to \$1,166,000,000 in 1910, and to \$1,381,500,000 in 1915.

**The Influence of the War of 1914-18.**—The influence of the War of 1914-18 upon the manufactures of Canada was profound and far-reaching, tending to promote the diversification of products and the production at home of many commodities that had previously been imported. On account of the practical suspension of the importation of manufactured goods of many kinds from Europe, enterprising Canadian manufacturers were given opportunities of entering upon new lines of manufacture with practical control of the market. There was added to this the reflex effect of the great prosperity of agriculture, produced by the unprecedented prices of war time, with the general result that industry worked at high pressure. Incidentally factory methods became more specialized, a high degree of administrative and mechanical efficiency was attained, and Canada became an important industrial country.

Since the annual Census of Manufactures was begun only in 1917, the growth of manufacturing production during the first years of the War of 1914-18 cannot be shown in Table 1. Figures of 1915 are not on a strictly comparable basis with those of later years. However, the effect of the inflation of the war period, which reached its height in the summer of 1920, is evident. The course of manufacturing production thereafter throughout the 1920's is clearly shown in the figures of the table. In 1929 gross values of production exceeded those of 1920, although the prices of manufactured goods had dropped about 41 p.c. in the intervening period.

**1.—Historical Summary of Statistics of Manufactures for the Dominion, 1870-1938.**

NOTE.—Statistics of the non-ferrous metal smelting industries were included in manufactures for the first time in 1925.

<sup>1</sup>In accordance with a resolution passed by the Conference of British Commonwealth Statisticians, 1935, the net value of production is now computed by subtracting the cost of fuel and electricity as well as the cost of materials from the gross value of the products. The figures for 1924 and later years have, therefore, been revised in accordance with this resolution. The revision could not be carried farther back as statistics for cost of electricity are not available for years prior to 1924. <sup>2</sup> Not reported. <sup>3</sup> A change in the method of computing the number of wage-earners in the years 1925 to 1930, inclusive, increased the number somewhat over that which the method otherwise used would have given. In 1931, however, the method in use prior to 1925 was re-adopted. The figures for 1931 and later years are, therefore, comparable with those for 1924 and earlier years.

**Effects of the Depression on the Manufacturing Industries of Canada.—**

The downward trend in manufacturing operations that began in the autumn of 1929 continued with increasing force to about the middle of 1933. As a result, the output of manufactured products in 1933 was lower in value than in any other year since the annual census was begun in 1917 but the wholesale price index for fully and chiefly manufactured goods on the 1926 base declined from 93.0 in 1929 to 70.2 in 1933, and rose only to 73.6 in 1936. Because of the advance in prices that commenced in 1936, the index number rose to 80.5 in 1937, the highest since 1930. That the decline in the volume of manufactures produced was not so great as that of values is evident by comparing the figures of Table 6, p. 405, with those of Table 3. Table 8, p. 408, shows in percentages the effect of the depression on employment, salaries and wages, and gross value of products. Both these analyses indicate that the incidence of the depression affected some industries much more than others. Generally speaking, the production of consumption goods was much better maintained than that of capital goods.

**Summary Statistics of Manufactures.**—In Table 4 will be found an analysis of the most important statistics of manufactures for certain representative years from 1917 to 1938. These trace the tendencies in Canadian manufacturing industries as clearly as possible through this latest period of their development. In analysing statistics of production and materials used, it should be borne in mind that, due to the inflation of values from 1914-18 and immediate post-war period and the drop in prices of commodities during the depressions of 1921 and 1930, the figures for these years are not completely comparable. One very important figure, however, which shows the trend of development clearly and uninterruptedly, is concerned with the use of power. The total horse-power employed increased from 1,658,475 in 1917 to 4,712,283 in 1937, an increase of 184 p.c. in twenty years. In the same period horse-power per wage-earner increased from 3.06 to 8.65, indicating the rapidly increasing utilization of electric power in manufacturing production. The significant feature is the increase in both the absolute figures of power employed and the averages per wage-earner during the depression years as compared with 1929, although the large numbers of persons again finding employment since 1933 have reduced the averages for later years. Another interesting comparison is the trend of value added by manufacture per employee and of average salaries and wages paid since 1929. Compared with 1917, the figures for average salaries and wages per employee in 1938 represent an increase of 33.9 p.c., while the estimated increase in the value added by manufacture per employee was only 5.3 p.c. Wholesale prices of commodities declined about 31 p.c. in the same period.

**Consumption of Manufactured Products.**—One of the beneficial results of adopting the same classification for external trade and for production is exhibited in Table 5, where the value of commodities made available for consumption in Canada is derived from these statistics. For example, the value of all manufactured commodities made available in a period approximately corresponding to 1937 was \$3,411,000,000, a figure obtained by adding to the value of manufactured products in 1937 the value of the imports of manufactured and partly manufactured goods during the fiscal year ended Mar. 31, 1938, and deducting the value of the corresponding exports for the same period. In this table more accurate statistics could be presented were it possible to exclude from the gross value of manufactured products the duplications involved when the products of one manufacturing establishment become the materials worked upon in another. Iron, vegetable, textile, wood and paper and animal products were, in that order, the leading groups in the value of finished goods made available for consumption. The large amount of manufactured vegetable products made available for consumption resulted from domestic production, as the exports and imports were about equal, while manufactures of textiles and iron and steel products, in addition to a large production, showed an excess of imports over exports of \$63,000,000 and \$132,000,000, respectively. Wood and paper, animal, and non-ferrous metal products were manufactured in Canada in greater quantities than required for home consumption providing export balances in these groups.

In 1937, (see Table 5), the order of the groups by the values available for consumption was unchanged from 1929, viz., iron, vegetable, textile, wood and paper, and animal products. Since 1929 the consumption of vegetable, animal, chemical, and textile products has been much better maintained than that of iron, non-metallic mineral, and wood products.

Averages, per wage-earner.....h.p.	3.06	3.97	6.45	6.67	7.62	10.82	9.11	8.65	8

<sup>1</sup> A change in the method of computing the number of wage-earners in the years 1925 to 1930, inclusive, increased the number somewhat over that which the method otherwise used would have given. There was, therefore, a proportionate reduction in the averages for 1925-30 per employee and wage-earner, as compared with what these averages would have been under the other method. In 1931, however, the method in use prior to 1925 was re-adopted. The figures for 1931 and later years are, therefore, comparable with those for 1924 and earlier years.

<sup>2</sup> Net values of products; see footnote 1, Table 1, p. 397.

<sup>3</sup> Not available at time of going to press.

### 5.—Consumption of Manufactured Products, by Groups, 1937, with Totals for 1922-37.

NOTE.—Statistics of manufacturing production are for the calendar year. Imports and exports of manufactured and partly manufactured goods are for the fiscal years ended Mar. 31 of the following years.

Year and Industrial Group.	Value of Products Manufactured.	Manufactured and Partly Manufactured Goods.		Value of Manufactured Products Available for Consumption. <sup>1</sup>

<sup>1</sup> Net imports are total imports less foreign products re-exported. For 1928 to 1937 foreign products imported and later re-exported are eliminated from the value of products available for consumption, but for 1927 and previous years this was impossible, since foreign exports for these years had never been analysed as raw materials or partly or fully manufactured goods. Therefore in this table the value of manufactured products made available for consumption, for the years 1922 to 1927, inclusive, is an overstatement by the amount of the foreign exports of manufactured goods in each year, probably varying from about \$11,000,000 in 1922 to \$18,000,000 in 1927.

### Subsection 2.—Value and Volume of Manufactured Products.

**Value of Manufactured Products.**—In the interpretation of manufacturing values over a number of years, variations in the level of prices must be borne in mind, especially when such variations have been as great as those in the period since the annual Census of Manufactures was begun in 1917. The index number of wholesale prices in Canada, on the 1926 base, compiled by the Dominion Bureau of Statistics, stood at 114.3 in 1917, 155.9 in 1920, 97.3 in 1922, 95.6 in 1929, 67.1 in 1933, and 84.6 in 1937. Index numbers of the prices of fully or chiefly manufactured goods were: 113.5 in 1917, 156.5 in 1920, 100.4 in 1922, 93.0 in 1929, 70.2 in 1933, 73.6 in 1936 and 80.5 in 1937.

**Volume of Manufacturing Production.\***—Since real income is ultimately measured in goods and services, the growth of the volume of manufacturing production, as distinguished from its value, becomes a matter of great significance. The important thing to know is whether consumers are getting more goods and services, not whether they are expending more dollars and cents.

\*For a much more detailed and comprehensive treatment of this subject, see the study "The Quantity of Manufacturing Production in Canada 1923-29" by A. Cohen, B. Com., Chief, General Manufactures Branch, Dominion Bureau of Statistics.

The index of volume is based on the quantities of manufactured products reported and covers 71.1 p.c. of the total value of the production in 1926. It is weighted according to the values added by manufacture in 1926. A complete description of the manner in which the index is constructed will be found in the publication referred to in the footnote to p. 404.

The physical volume of manufacturing production increased 50.2 p.c. from 1923 to 1929. When it is recalled that the population of Canada is estimated to have increased only 11.3 p.c. during the same period, the growth of manufacturing production is indeed remarkable. Of this advance, the part resulting from an increase in the domestic demand due to growth of population would be about 11.3 p.c. Exports of partly and fully manufactured goods increased from \$591,830,000 in the fiscal year ended Mar. 31, 1924, to \$686,876,000 in the fiscal year 1930, the increase in exports representing about 3.6 p.c. of the 1923 production. The remainder of the increase in production by 1929, or a margin equal to roughly 35 p.c. of the volume of manufactures of 1923, was, therefore, apparently absorbed by increases in capital equipment and by the rise in the standard of living of the population of Canada.

A similar analysis of the volume of manufactures since 1929 in relation to population and exports would show that the decline in the depression was due chiefly to reduced exports and a cessation in production of capital equipment.

As may be seen from Table 6, all groups in the component material classification reported declines in the volume of production during the depression. In comparing the low point of the depression, viz., 1933, with 1929, it is found that the iron and steel group suffered the greatest contraction in production with a decrease of 61.1 p.c. Since 1933 there has been material improvement in all groups, the index of production for all industries rising from 82.0 in 1933 to 132.0 in 1937. For the latest year three groups, viz., iron and its products, non-metallic minerals, and miscellaneous industries were below the level of 1929, but in each case the volume of production was very much upward compared with 1936.

In analysing the changes in the volume of production, on the purpose classification basis, some interesting facts are revealed. In comparing 1933 with 1929 it is found that the food group reported a decrease of 10.6 p.c., while that of clothing decreased 14.7 p.c. The output of vehicles and vessels, which is largely made up of the automobile and rubber-tire industries, recorded a decrease of 59.5 p.c.—this is the greatest decrease of any group. Producers materials and industrial equipment declined 37.5 p.c. and 45.8 p.c., respectively, due to the general decline in industrial activity. House furnishings dropped 36.6 p.c., personal utilities 30.3 p.c., drink and tobacco 31.5 p.c., and books and stationery 7.2 p.c. The decrease in the personal utilities group needs some explanation. The production of musical instruments, which is included in this group, has been decreasing steadily during the past few years, the output of pianos, phonographs, and phonograph records becoming smaller and smaller. The main product of the musical instruments industry, namely, the radio, is now produced in the electrical apparatus industry. This industry, however, is credited to the industrial equipment group, as by far the largest part of its output consists of industrial equipment.

All groups shared in the improvement since 1933, and all groups, with the exception of vehicles and vessels, showed increases in 1937 over 1929, the greatest percentage advances being in miscellaneous 65.6, books and stationery 28.4, drink and tobacco 16.2, and food 13.5.

The index of the physical volume of production dropped from 122.9 in 1929 to 82.0 in 1933 and has risen to 132.0 in 1937, being a net increase of 7.4 p.c. over 1929. This increase is significant when compared with a decrease of 14.0 p.c. in the net value of production and 5.7 p.c. in the number of wage-earners employed.

The construction of this new index of the volume of manufacturing production has superseded, for 1923 and later years, the index published in 1931 and previous years, and which was shown on p. 389 of the 1939 Year Book.

## Section 2.—Production of Industrial Groups and Individual Industries.

For the purposes of the Census of Manufactures, the main detailed analysis is made under a classification in which industries are grouped according to the chief component material of the goods manufactured. This is, therefore, the grouping used in Table 9, where the statistics of individual industries are presented in detail, and in the historical series already shown in Table 3. However, there are also less detailed analyses under purpose groupings appearing in Table 10 and under origin groupings in Table 11.

### Subsection 1.—Manufactures Grouped by Chief Component Materials.

A classification based on the chief component materials in the various products of each manufacturing establishment was applied for the first time in the compilation of the returns for 1920. The number of groups was reduced from fifteen to nine to correspond with the external trade classification and the classes of industry were somewhat altered to conform with recent industrial developments. Subsequently, a number of minor changes have been made, the most important being the elimination of central electric stations and the dyeing, cleaning and laundry industry from the compilation in 1936. Revisions due to these changes have been carried back to 1917 in so far as possible.

**Effects of the Depression upon the Main Groups.**—In Table 8, is shown the effects of the depression and the recovery since 1933 upon the main groups of industries with regard to the numbers employed, the salaries and wages paid, and the gross value of products. Owing to the price decline in the depression, money values both of wages and of products were naturally affected more than the number of employees. Furthermore, during periods of curtailed production there is a tendency for wage-earners to be put on part time, while the number of salaried employees responds less quickly to reduction in output than that of wage-earners. Therefore, there are a number of reasons why the variation in the number of employees should be less than that of money values. The figures of Table 8 should be compared with those of Table 6 which show changes in volume of production.

As noted elsewhere in this chapter (especially under the discussion of volume of manufacturing production on pp. 404 to 406), the depression affected the production of capital or durable goods much more than that of consumption goods. Therefore, production in such groups as iron products, and wood and paper products declined more seriously than that in such groups as textiles, vegetable products, and animal products, and in 1937 the recovery had not progressed far enough for the production of durable goods to have regained the relative position it held in 1929.

### 8.—Percentage Variation in Employment, Salaries and Wages, and Gross Value of Products in the Main Industrial Groups Compared for Specific Years, 1929, 1933 and 1937.

NOTE.—The highest pre-depression year was 1929, while the lowest depression year was 1933.

Industrial Groups.	1933 Compared with 1929.			1937 Compared with 1929.			1937 Compared with 1933.

**Vegetable Products.**—The industries of this group are mainly dependent upon the agricultural crops of Canada for their raw materials and, in some instances, their products enter largely into the export trade. However, there are some important industries in the group—e.g., the rubber industry—that are almost entirely dependent upon imported raw materials.

*The Flour-Milling Industry.*—This is the most important member of the group from the standpoint of gross value of production. Under modern conditions the industry has a capacity for flour production far in excess of domestic consumption, so that its prosperity has fluctuated widely with the condition of the export market. Exports of wheat flour declined from 10,737,000 barrels in 1928 to 4,087,000 in 1937, but in spite of the decrease Canada continues to be one of the leading exporters of wheat flour. A majority of flour-mills also grind coarse grains for the production of live-stock feed. In rural districts there are many small mills devoted entirely to the grinding or chopping of feed grains, usually on a custom basis.

#### FLOUR-MILLS OF CANADA, WITH THEIR EQUIPMENT AND CAPACITIES, BY PROVINCES, 1937, WITH TOTALS, 1936.

**Bread and Bakery Products.**—With the increase in urban population, and the changes resulting from motor transportation which make it possible for factory-made bread to be economically distributed in rural communities, the bread industry

has expanded rapidly in the past decade. Table 12, p. 426, shows that in 1937 this industry ranked eleventh in gross value of products, ninth in net value, fifth in number of employees, and eighth in salaries and wages paid.

*Rubber Goods.*—The rubber industry in 1937 ranked third in this group and thirteenth among the industries of Canada in gross value of products. This industry is, of course, closely related to the use of motor vehicles, and the fact that in 1937 Canada stood fifth among the nations of the world in the number of such vehicles registered, partly accounts for her ranking among the leading countries as a manufacturer of rubber goods. The industry is able to operate so efficiently in Canada upon a quantity basis that, besides supplying the domestic market, it contributes largely to the export trade. See the "Condensed Preliminary Report on the Trade of Canada, 1938-39", p. 51, where it is shown that in 1938 Canada ranked third among the countries of the world in the export of rubber tires.

*Fruit and Vegetable Preparations.*—This industry, which includes canned fruits, canned vegetables, pickles, vinegar, jams, etc., is another important member of the vegetable products group. The industry has grown rapidly since the War of 1914-18. During the period 1923-37 the volume of fruit and vegetable preparations produced increased over 220 p.c. (see Table 7, p. 406). This growth is remarkable as it represents an increase in the domestic demand, both imports and exports being relatively small as compared with domestic production, although there is a small export surplus.

*Tobacco, Cigars, and Cigarettes.*—The tobacco manufacturing industry is another important division of this group that caters very largely to the domestic market. Imports and exports of manufactured tobacco are small. The industry normally absorbs about three-quarters of the tobacco crop of Canada, although a proportion of imported raw leaf is used for blending.

Other important industries of this group are: biscuits and confectionery, brewing, sugar refineries, and coffee, tea, and spices. With regard to the sugar-refining industry, refineries situated on the Atlantic and Pacific Coasts use imported raw cane sugars, while others in western Ontario and Alberta manufacture beet sugar. The production of the latter is shown in the Agriculture chapter, pp. 224-225.

*Animal Products.*—The industries of this group process the products of agricultural live stock, of fisheries, and of fur-bearing animals.

*Slaughtering and Meat Packing.*—The products of this, the leading industry of the group, besides supplying the home market, constitute an important element in exports, especially bacon and hams. The growth of the industry from a production valued at \$3,800,000 in 1870, and \$7,100,000 in 1890, to that of to-day has been accompanied by a concentration of the major part of the production into a comparatively small number of large establishments, thereby facilitating greater efficiency of operation and the utilization of by-products for the production of fertilizers, glue, and canned meats and soups. There has been a large increase in the number of establishments since 1930, due to the inclusion of wholesale butchers operating small plants engaged in slaughtering only. The inclusion of these small establishments did not affect materially the value of production of the industry. The numbers of live stock slaughtered at Canadian inspected establishments are shown in the Internal Trade chapter (see Index).

*Butter and Cheese.*—For many years this industry has been of leading importance in Canada. It originated in the mixed-farming and dairying districts of Eastern Canada, and about the beginning of the present century large quantities of butter

and cheese were exported. However, with the increase of population and expansion of grain growing on the prairies, exports of these products declined. Since the War of 1914-18 there has been a tendency for mixed farming and dairying to spread in certain districts of the West and in certain years a considerable export movement of butter has again occurred. Cheese production has declined since the War of 1914-18, but a large proportion of the production is still exported. Further information regarding the dairy industries appears in the Agriculture chapter at pp. 216 to 220.

*Leather Tanneries, and Boots and Shoes.*—The tanning industry has long been established on a considerable scale, mainly, of course, because the large numbers of cattle raised and slaughtered provide a ready supply of hides. The industry is now so well developed that there is an export surplus of tanned leather. The boot and shoe industry almost completely supplies the home market in standard lines, the small import surplus being largely confined to expensive shoes. The tanning industry is centred chiefly in Ontario, but more than half the total boots and shoes are manufactured in the Province of Quebec.

*Fish Curing and Packing.*—This industry occupies an important place in relation to the fisheries of Canada. A considerable proportion of the annual catch is exported to foreign markets in cured and canned forms. Further information regarding the industry appears in the Fisheries chapter especially at pp. 293 to 295.

**Textile Products.**—The industries of this group have developed from the household spinning and weaving of the early settlers. They now supply the bulk of the requirements of domestic consumption (see Table 5, p. 404). The import balance under this heading consists largely of either raw materials or fine goods that cannot be competitively manufactured in Canada. Two important raw materials consumed by branches of industry in this group—namely, raw cotton and raw silk—are entirely imported. The industries of this group are developed chiefly in the eastern provinces, where the factors of climate, cheap power, available labour forces, and accessibility of raw materials are favourable to large-scale growth.

In net production, i.e., in value added by manufacture, which is a truer criterion than gross production of the place of the group in the industrial life of the country, the textile group was fifth in 1937 among the nine major groups shown in the summary statistics of Table 3, p. 401, being exceeded by the wood and paper, iron and its products, vegetable, and non-ferrous metal products groups. Textiles accounted for about 12 p.c. of the net manufacturing production of Canada. As an indication of the contribution that the textile group made in 1937 to employment in the Dominion, the group stood third in the number of employees and third in salaries and wages paid, with about 18·4 p.c. of the total employees in manufacturing and 14·5 p.c. of the total salaries and wages paid. (See Table 19, p. 437.) The manufacture of textiles may be regarded under two general divisions: (1) the spinning, weaving, and knitting trades, and (2) the finishing trades. In the past, the second division, which consists principally of the making up of piece goods into articles of clothing, has been the larger, but in recent years there has been a tendency for the first or primary division to equal or exceed the second in value of production.

*Cotton Yarn and Cloth.*—This is the largest industry in the textile group. In 1937 it ranked fourteenth among the industries of Canada (see Table 12, p. 426), and third among the industries of Quebec (Table 4, p. 458).

*Finishing Trades.*—As already mentioned, the industries engaged in making up piece goods into clothing are a very important division of the textile group. The largest of these industries are women's factory clothing, men's factory clothing, and men's furnishing goods, while the manufacture of hats and caps and of corsets are somewhat smaller industries in the same division. The manufacture of woollen textiles is not so largely developed in Canada as that of other textile products. Nevertheless, the woollen cloth, woollen goods, *n. e. s.*, woollen yarn, and carpet industries, taken together, constitute quite a large textile production and, in addition, the products of the hosiery and knitted goods industry include a large percentage of woollen materials. Detailed statistics of these industries are shown in Table 9, while their relative importance compared with other industries in Canada appears in Tables 12 and 12A. Imports and exports of textile products may be found in Tables 12 and 13 of the External Trade chapter (see Index).

*Hosiery and Knitted Goods.*—This industry is important from the standpoint of employment in the Dominion. In 1937, although ranking only eighteenth in value of production, it was thirteenth in salaries and wages paid (Table 12, p. 426). The volume of knitted goods produced has increased materially in the years since 1934, being 131.8 in 1937 compared with 111.4 in 1929.

*Silk and Artificial Silk.*—This industry has shown a remarkable expansion during recent years. While the great majority of other manufactures have scarcely yet regained the level of production attained in 1929, this industry has since then increased 21 p.c. in capital investment, 135 p.c. in number of employees, 138 p.c. in salaries and wages paid, 96 p.c. in net value, and 93 p.c. in gross value of production. As most of these comparisons are in money values, the record is especially remarkable in view of the decline in price levels during the period. Much of the growth has been due to the development of artificial silk textiles.

*Wood and Paper Products.*—While the gross value of production by industries of this group ranked third in 1937 among the main groups, following vegetable products and iron products, the wood and paper group stood highest in net values, capital employed, employees, and salaries and wages paid. These industries draw their raw materials almost entirely from the forests of Canada. The primary operations in the woods provide work during part of the year for an average of 200,000 individuals, largely during the season when other forms of employment are at their minimum. This has a valuable steadying effect on general labour conditions throughout the year.

The operations of the two leading industries under this group, namely, pulp and paper mills and sawmills, are treated fully in the Forestry chapter at pp. 265 to 276, while statistics regarding capital, employees, power installed, etc., appear in Table 9, p. 416.

The printing industries—printing and publishing, printing and bookbinding, lithographing, engraving, and trade composition—are included within this group

because paper is the principal material used by them. The first two especially make an important contribution to manufacturing production in Canada, as indicated by their place in the forty leading industries (Table 12). Other large industries included in the wood and paper group are: paper boxes and bags, furniture, and planing mills, sash and door factories.

**Iron and Its Products.**—The gross value of production by industries of this group was second among the nine main groups in 1937. In periods of active prosperity the relative standing of the group tends to rise; it stood first in 1920 and 1929, while in 1933 it was fifth (Table 3). The value of production increased nearly three times from 1933 to 1937, while the volume (Table 6) increased by 136 p.c. The demand for durable goods depends in large measure upon the rate of capital improvement, which is almost at a standstill in times of depression and rises to a high level in times of prosperity.

*Primary Iron and Steel.*—There are at present four companies operating blast furnaces in Canada for the production of pig-iron. One of these is located in Nova Scotia and uses local coal and iron ore from the great Wabana deposit in Newfoundland which it controls. The other three are located in Ontario on the Great Lakes waterways where they have the advantage of cheap water transportation for iron ore imported from the Messabi Range of Minnesota and coal from Pennsylvania. These firms also operate open-hearth steel furnaces and rolling mills to make steel ingots, blooms and billets, merchant and alloy steel bars, rails, structural shapes, plates, sheets, rail fastenings, etc. There is also a large production in Canada of ferro-alloys (ferro-silicon, ferro-manganese, etc.) which are produced in electric furnaces. These alloys usually constitute the most important item of Canadian exports of primary iron. Output of these products since 1920 is shown in Table 16 of the Mines and Minerals chapter, p. 337.

*Automobiles.*—This is the most important industry of the iron group and is indeed one of the largest industries in Canada (Table 12). Table 4 of Part III of the Transportation chapter shows the number of vehicles manufactured, imported, and exported in each year, while in the Internal Trade chapter the retail sales of motor vehicles are shown.

*Automobile Supplies.*—As an adjunct to the manufacture and wide use of motor vehicles, a large industry has developed for the independent production of parts and supplies required for the making, repair, and upkeep of such vehicles.

*Railway Rolling-Stock.*—With railway transportation so important a factor in the economic life of Canada, the manufacture and repair of railway vehicles is a large and widespread industry. In addition to rolling-stock for the standard steam and electric railways, the industry produces locomotives and cars for industrial, mining, and engineering purposes. The industry stands high among the industries of Canada in the number of employees engaged and in salaries and wages paid.

Other important industries classified under the iron group are: machinery, sheet metal products, castings and forgings, wire and wire goods, hardware and tools, agricultural implements, etc. The manufacture of agricultural implements has been at a low level for some years owing to the depressed condition of agriculture, especially in the grain-growing West.

**Non-Ferrous Metals.**—Two industries classified under this group have shown outstanding development in the period since the War of 1914-18.

*Non-Ferrous Metal Smelting and Refining.*—This industry now ranks first in gross value of products and second in net value. An important factor in its rapid growth has been the discovery and development of a number of large deposits of base metal ores in Canada, while the availability of low-cost electric power has been another factor in its expansion. This latter factor accounts very largely for the establishment of one large plant on the Saguenay where imported aluminium ore is smelted into bars and other forms of pure metal for export. The products of the whole industry now constitute an important element of the export trade.

*Electrical Apparatus and Supplies.*—The total horse-power installed in central electric stations in Canada has increased from 1,900,000 in 1919 to 7,477,000 in 1938, while the production in kilowatt hours has increased in the same period from 5,500,000,000 to 26,154,000,000 (see Table 6, Water Powers chapter, p. 369). Accompanying this growth of production there has been a very widespread extension of the use of electricity for industrial, commercial, and domestic purposes. A large market has therefore developed in Canada for a wide variety of electrical equipment from the largest generators down to household appliances, and a very large industry (eighth among the industries of Canada in 1937, as shown in Table 12) has grown up to supply that market.

**Non-Metallic Mineral Products.**—About half the total production of this group is accounted for by the petroleum-refining industry.

*Petroleum Products.*—The petroleum-refining industry has grown to its present size with the increased use of motor vehicles. In the past the crude petroleum has been largely imported and the refineries were located where such imports were economically available either by water or pipe-line transportation. Developments in the Turner Valley are providing a large supply of crude petroleum in Canada.

*Coke and Gas Products.*—This industry, being chiefly the production of domestic heating and illuminating gas, has not shown striking expansion, being affected by the competition of low-cost electricity. However, most of the main centres of population are provided with gas services. Production in 1921, valued at \$33,000,000, compares with a production valued at \$42,000,000 for 1937.

Other important industries included in the non-metallic mineral group are: glass products, abrasives, cement, and clay products. The two last-mentioned industries, which in recent years have been below normal production owing to the low level of activity in construction and building, showed some improvement in 1937. The manufacture of artificial abrasives is well developed in Canada because of the advantage of low-cost electric power and a considerable part of the product of the industry is exported.

**Chemicals and Allied Products.**—Industries of this group are widely developed in Canada. Production attained a very high level during the War of 1914-18. However, since those war industries disappeared there has been a very real growth for ordinary commercial and industrial purposes. Volume of production under this group was higher in 1937 than in any other year since 1923 (Table 6).

### Subsection 2.—Manufactures Classified by the Purpose of the Products.

In addition to the classification according to the chief component material of the products used for the industrial census in detailed presentation, a separate and distinct classification, based on the chief purpose of the products, was applied for the first time to the census returns of 1922.

Significant changes have occurred since 1922 in the importance of the various groups shown in the purpose classification. Indicative of the increasing industrialization of the Dominion is the increase in the industrial equipment group from 14.2 p.c. of the total value of production in 1922 to 15.2 p.c. of the total in 1937, and the increase in producers materials from 27.9 p.c. to 33.7 p.c. during the same period. Another significant change is the decline in the food group which dropped from a production of 28.2 p.c. to 21.8 p.c. of the total. Whereas in 1922 food products comprised the leading group, in 1937 the production of producers materials ranked first in importance. It should also be noted, however, that the cost of materials in this group is abnormally high. Vehicles and vessels advanced from an output of 6.7 p.c. of the total value of production in 1922 to 8.8 p.c. in 1937, and miscellaneous from 0.2 p.c. to 0.9 p.c.; drink and tobacco held the same proportion at 4.2 p.c.

### 10.—Principal Statistics of the Manufacturing Industries of Canada, Classified According to the Purpose of the Principal Product, by Main Groups, Representative Years 1922-37, and in Detail for 1937.

<b>Totals, 1926.....</b>	<b>21,301</b>	<b>3,208,071,197</b>	<b>559,161</b>	<b>625,682,242</b>	<b>1,726,520,016<sup>1</sup></b>	<b>3,114,693,230<sup>1</sup></b>

<sup>1</sup> For the years 1922, 1924, and 1926 the figures for cost of materials and gross value of products include the value placed on intermediate products used in further processes in the chemical group of industries. For this reason these figures differ slightly from those contained in the other tables of this report.

**10.—Principal Statistics of the Manufacturing Industries of Canada, Classified According to the Purpose of the Principal Product, by Main Groups, Representative Years 1922-37, and in Detail for 1937—continued.**

**Subsection 3.—Manufactures Classified by Origin of the Materials.**

A study of manufactures, classified upon the basis of origin, as presented in Table 11, leads to the analysis of manufacturing production from another angle, and interesting comparisons can be made with the external trade classification according to origin (see Table 15 of the External Trade chapter).

The distinction made between farm materials of Canadian and foreign origin is based on whether the materials are indigenous to Canada rather than on their actual source. Thus, the industries included in the foreign origin classes are those depending upon materials that cannot be grown in Canada, such as tea, coffee, spices, cane sugar, rice, rubber, cotton, etc. Industries included in the Canadian origin classes may be using large quantities of imported materials, however.

The mineral origin group includes, in addition to the non-ferrous metals so largely produced in Canada, the manufactures of iron and steel, of petroleum, and of other mineral substances the raw materials for which are very largely imported. Products of mineral origin, with the exception of fuels, are nearly all durable goods.

A high standard of living and advanced industrial organization is usually indicated by a relatively large production and consumption of mineral products. In 1937, the gross value of manufactures of mineral origin in Canada exceeded those of farm origin, which included raw materials for textiles as well as foods.

In value added in manufacture the mineral origin group advanced from second place in 1924 with 30.5 p.c. of the total value added by manufacture in all industries to first place in 1937 with 41.1 p.c. of the total. On the other hand, the manufacture of materials of farm origin receded from first place with 33.3 p.c. in 1924 to second place with 28.8 p.c. of the total in 1937. The value added in the manufacture of material of forest origin was in third place at both the beginning and the end of the period, but the proportion dropped from 26.0 p.c. in 1924 to 20.7 p.c. in 1937. These three groups accounted for about 90 p.c. of the value added.

In 1937, industries of the mineral group had the largest number of employees, the greatest capital, and paid out the most in salaries and wages. Industries of this group had an average capital per employee of nearly \$6,500 and an average salary or wage of \$1,292, while for industries of the farm origin group the respective averages were \$4,400 and \$970.

**11.—Principal Statistics of the Manufacturing Industries of Canada, Classified According to the Origin of the Material Used, by Main Groups, Representative Years 1924-37.**

<sup>1</sup>For the years 1924 and 1926 the figures for cost of materials and gross value of products include the value placed on intermediate products used in further processes in the chemical group of industries. For this reason these figures differ slightly from those contained in the other tables of this report.

**Subsection 4.—Leading Manufacturing Industries.**

In the following statement, the rank of the ten leading industries in 1937, from the standpoint of gross value of production, is compared with their respective ranks in representative years since 1922.

**THE TEN LEADING INDUSTRIES, 1937, COMPARED AS TO RANK, REPRESENTATIVE YEARS 1922-36.**

Industry.	Rank in—						
	1937.	1936.	1934.	1933.	1929.	1926.	1922.
Non-ferrous metal smelting and refining....	1	1	2	2	9	9	—
Pulp and paper.....	2	2	1	1	1	1	2
Slaughtering and meat packing.....	3	3	3	3	2	3	3
Automobiles.....	4	6	7	11	4	5	6
Flour and feed mills.....	5	4	4	4	3	2	1
Butter and cheese.....	6	5	5	5	6	6	5
Sawmills.....	7	8	11	14	5	4	4
Electrical apparatus and supplies.....	8	9	14	16	8	13	17
Petroleum products.....	9	7	6	6	10	11	9
Railway rolling-stock.....	10	14	24	24	8	11	25

A prominent feature of Canadian manufacturing development in recent years has been the growth of non-ferrous metal smelting. This industry, based upon mineral resources, has now taken its place among the leading manufactures along with the industries based upon forest, agricultural, and live-stock resources.

The incidence of the depression resulted in a re-arrangement in the rank of many industries which has proved temporary in some cases. The suspension or curtailment of capital expenditures greatly reduced the output of such important industries as: sawmills, electrical equipment, automobiles, railway rolling-stock, primary iron and steel, machinery, etc. On the other hand, the demand for goods for immediate consumption was more stable, including such industries as: petroleum products, bakeries, cotton yarn and cloth, printing and publishing, clothing, tobacco, beverages, etc.

**12.—Principal Statistics of the Forty Leading Industries of Canada, Ranked According to the Gross Value of the Products, 1937.**

## Section 3.—Principal Factors in Manufacturing Production.

### Subsection 1.—Capital Employed.

The remarkable increase in capital employed in Canadian manufactures from the beginning of the twentieth century denotes rapid growth in industrial operations. From 1900 to 1905 the capital increased from \$446,900,000 to \$833,900,000, and advanced to \$1,958,700,000 in 1915. During this period returns were received from establishments with 5 hands or over, and, while the rise in wholesale prices did not exceed 37 p.c., the capital employed in manufactures increased nearly 340 p.c.

The capital investment in 1937 in all establishments, irrespective of the number of employees, but exclusive of central electric stations, was \$3,465,000,000 as compared with \$2,334,000,000 in 1917, an increase of 48 p.c. in 20 years, while wholesale prices have declined about 34 p.c. in the same period.

The wood and paper products led in 1937. Next in importance were the iron and its products and the vegetable products groups, respectively. It is interesting to note that in the case of the wood, iron, non-metallic mineral, and chemical groups the capital exceeded the gross value of products, while in the remaining groups the reverse was the case. These remaining groups, however, had relatively high material costs. By a comparison with Table 19, the non-metallic mineral group had the largest capital per wage-earner and also paid the highest average wage, but this relationship does not hold good in the case of all groups.

The statistics of capital employed in the manufacturing industries are of interest in deducing the proportions of fixed and liquid assets. In 1924, land, buildings, machinery and tools constituted 59 p.c. of the total capital; in 1929 the proportion was still 59 p.c.; in 1933 it was 66 p.c.; but in 1937 it had declined again to 61 p.c. The fixed assets amounted to \$2,127,000,000 in 1937, while current assets, including inventories of raw materials and finished products, bills and accounts receivable, cash, and sundries, were valued at \$1,338,000,000. Details by provinces and industrial groups are given in Table 14.

**Subsection 2.—Employment in Manufactures.**

The numbers of salaried employees and wage-earners, ascertained by the methods outlined below, are given, for each of the years 1931 to 1937, in Table 15. The total number of persons engaged in those manufacturing industries of Canada for which statistics were obtained in 1937 was 660,451, as compared with 468,658 in the same industries in 1933. The 1937 employees included 115,827 salaried employees, this figure being obtained from the manufacturers at the end of the year, and 544,624 wage-earners, the average number employed as derived from the manufacturers' records of the numbers on the payrolls on the 15th of each of the twelve months. Using the year 1917 as a base, and taking the percentages of the wage-earners and the total employees in each year, by dividing these percentages into the corresponding volumes of manufacturing production (see p. 405 for the index of volume), tentative conclusions are arrived at regarding the efficiency of production per wage-earner and per employee. These indexes of the efficiency of production are, of course, affected by the changes in the method of computing the number of employees adopted in 1925, and then again in 1931. Inasmuch as the change increased the apparent number of employees between 1925 and 1930, it proportionately decreased the index of the efficiency of production. The table illustrates the development of modern industry which has accomplished, by better organization and the use of improved equipment, a large increase in production with a comparatively small increase in wage-earners. Capital invested in manufacturing industries has increased by 48 p.c. from 1917 to 1937, compared with an increase of 0.6 p.c. in wage-earners, while the horse-power used per wage-earner has increased from 3.06 in 1917 to 8.65 in 1937. The factor of better organization is not susceptible to measurement. However, salaried employees have increased 78 p.c. since 1917, or more nearly in proportion to the growth in production than wage-earners. The result of these developments has been the increase of 68.1 p.c. in the efficiency of production per wage-earner and a smaller increase of 55.0 p.c. per employee, owing to the increased proportion of salaried employees in the total. The indexes may be considered as supplying satisfactory evidence of a general gain in volume of production per person employed. In this connection it should be remembered, however, that in 1917, owing to the large numbers overseas, many persons of low efficiency were being employed, their inefficiency being concealed at the time by the prevailing inflation of prices; it is possible that the sudden rise in the indexes of efficiency in 1921 and 1922 may be partly accounted for by the elimination of less competent workers in the contraction of industrial operations that occurred at that time. During the recent depression years the reduced volume of production lowered the indexes of efficiency.

# 15.—Salaried Employees and Wage-Earners in the Manufacturing Industries of Canada, with Volume of Manufacturing Production and Comparative Efficiency of Production, 1931-37.

(1917=100.)

NOTE.—Figures, with qualifications as to comparability, for 1917 to 1930 are given on p. 421 of the 1939 Year Book.

Year.	Salaried Employees.	Wage-Earners.	Total Employees.	Percentages Relative to 1917.		Index Number of Volume of Mfd. Products.	Indexes of Efficiency of Production.	
				Of * Wage-Earners.	Of Total Em- ployees.		Per Wage-Earner.	Per Em- ployee.

**Distribution of Employees in 1937.**—The percentages, by provinces and industrial groups, of employees on salaries and on wages are shown for 1937 in Table 16. The actual numbers upon which these percentages are based appear in Table 19. Interesting comparisons may be made with the distribution of capital appearing in Tables 13 and 14 and with that of values produced shown in Tables 2 and 3. In 1937, the 24,834 establishments covered, employed 115,827 salaried employees and 544,624 wage-earners, a total of 660,451 persons. Out of every 1,000 persons employed in manufacturing, 175 were classed as salary earners and 825 as wage-earners; the former earned 27.2 p.c. and the latter 72.8 p.c. of the total amount paid out as remuneration for services.

Ontario had a lower percentage of both salaried employees and wage-earners than its proportion of gross production (51.8 p.c.) or of net production (53.3 p.c.). In Quebec, on the other hand, the percentages of both salaried and wage-earning employees were higher than the proportions of gross (28.8 p.c.) and net (29.5 p.c.) production. The percentages of salaries were relatively high in both Ontario and Quebec, as these provinces contain the head offices of many large corporations with their salaried executives. In Ontario the percentage of female salaried employees was higher than that of the male, i.e., it had a larger proportion of females among its salaried employees than the other provinces. The same was true of Quebec with regard to the wage-earners, due, no doubt, to the textile industries of Quebec.

The proportion of salaried employees was relatively high in the wood and paper group, while the proportion of wage-earning employees was high in the wood and paper, the textile, and the iron groups. The proportion of females to males among both salaried and wage-earning employees was high in the textile group. The vegetable products group also had a high proportion of female wage-earners, while the wood and paper, iron, and non-metallic mineral groups had very low proportions. It is of interest to note that out of every 1,000 wage-earners in the textile industries 539 were females, while in all other groups 135 were females. The importance of the textile industries in providing employment to females is strikingly illustrated by the fact that out of all female wage-earners engaged in the manufacturing industries of Canada, 49.5 p.c. were found in the textile group.

# 16.—Percentages of Male and Female Employees on Salaries and Wages and Percentages of Total Salaries and Wages, by Provinces and Industrial Groups, 1937.

NOTE.—For actual figures upon which this table is based, see Table 19.

**Monthly Record of Employment in Manufactures.**—A monthly record of the numbers of wage-earners employed in Canadian manufactures, as compiled from the Census of Industry, is given in Table 17 for representative years 1922 to 1937 and by sex for certain of the years. Ordinarily, manufacturing employment in Canada reaches its highest point during the summer months. Some of the seasonal industries, such as canning, are most active then, textile industries are preparing winter goods, and industry generally feels the active demand of the agricultural purchasing power resulting from the prospects of the season's harvest. After the check of 1929, employment during 1930, 1931, 1932 and the first half of 1933 declined steadily, the monthly employment figures in each case being lower than the corresponding month of the previous year. The previous peak of employment was in June, 1929, when 575,693 wage-earners were on the payrolls. This compared with the high month in 1933 of 410,954 wage-earners, 444,151 in 1934, 476,961 in 1935, 511,072 in 1936 and 582,305 in 1937. In July, 1933, employment took an upward swing; the improvement has been generally maintained since then.

**Hours Worked by Wage-Earners.**—The numbers of wage-earners working specified numbers of hours per week in the month of highest employment in 1932 to 1937 with details for the latest year are shown in Table 18. An explanation should be made of the term “month of highest employment” as there used. Each firm is required to report the number of hours per week worked by its wage-earners during the month in which the greatest number have been employed. In the case of one firm, the month of highest employment might be May, in that of another firm, October. The month of highest employment as shown in the following table, therefore, does not refer to any particular month but represents the summation of the different months of highest employment as reported by all firms. For a given industry, however, the month of highest employment has more significance, as in this case it coincides for a great number of the firms engaged in the same industry.

# 18.—Wage-Earners Working Specified Numbers of Hours per Week in the Month of Highest Employment, 1932-36, and in Detail by Provinces, Groups, and the Forty Leading Industries, 1937.

NOTE.—These are the regular hours worked per week and do not therefore include overtime.

1 Figures not available.

The number of hours worked per week is affected both by business conditions and by changes due to government legislation and union demands. In times of depression the average number of hours per week is reduced, due to the policy of some employers of spreading the available work over as many employees as possible. With the return of better times the number of hours worked by each employee is naturally increased. This increase is, however, offset by the reduction in hours through legislative enactments and union agreements. The period of six years, for which the figures of Table 18 are available, is not long enough to establish a definite trend in the average hours worked.

For Canada as a whole, 37 p.c. of the wage-earners worked under 48 hours in 1937, 22 p.c. worked 48 hours, 20 p.c. worked between 49 and 54 hours, while 21 p.c. worked 55 hours or over.

### **Subsection 3.—Salaries and Wages in Canadian Manufacturing Industries.**

The total salaries and wages disbursed by manufacturers in 1937 was \$721,727,-037 paid to 660,451 workers, compared with \$777,291,217 paid to 666,531 persons in 1929 and \$497,801,844 paid to 606,523 persons in 1917. Of the 1937 aggregate, \$195,983,475 or 27.1 p.c. was paid to 115,827 salaried employees who constituted 17.6 p.c. of the total number, and \$525,743,562 or 72.9 p.c. was paid in wages to 544,624 wage-earners, who formed 82.4 p.c. of the aggregate number of employees.

The average salary paid in the manufacturing industries during 1937 was \$1,692, compared with \$2,007 in 1930 and \$1,315 in 1917, while the average wage in 1937 was \$965, compared with \$777 in 1933, \$1,042 in 1929 and \$762 in 1917. Thus during the twenty years since 1917, average salaries have increased by 29 p.c., while average wages have increased by 27 p.c. (See Table 20.)

**Average Earnings, by Provinces and Industrial Groups.**—In 1937, British Columbia showed the highest average salary of \$1,781, followed by Ontario with \$1,773, Quebec, \$1,621, and Manitoba with \$1,618. The head offices of many large corporations being located in Montreal, Toronto, Vancouver, and Winnipeg tends to raise the average salaries in the provinces in which these cities are situated. In the other provinces the averages were smaller, the lowest being in Saskatchewan. No regional tendency is observable in average salaries as shown in Table 19.

British Columbia, with average wages paid of \$1,122 per annum, was the highest in 1937, being \$157 higher than the general average. In the western provinces, average wages are usually higher, due to an unusually small proportion of women workers. In the three most easterly provinces average wages in manufacturing were lower than the mean for the Dominion, Quebec average was the same, while from Ontario westward the averages were higher. The seasonal nature of some of the leading industries, notably fish preserving and lumbering, tends to reduce the mean wage in the Maritime Provinces and Quebec. In addition to this, Quebec has a larger proportion of female wage-earners (employed chiefly in the textile, food, and tobacco industries) than any other province except Prince Edward Island.

In 1937 the highest average salary, viz., \$1,929 was reported by the non-ferrous metal products group, while the animal products group, with an average salary of \$1,343, was the lowest. In wages paid, the iron and the non-metallic groups were highest with averages of \$1,186 and \$1,155, respectively, there being few female wage-earners in these groups. The textile industries, on the other hand had the lowest average wage of \$749 due to the fact that in this group about 54 p.c. of the wage-earners were females. As is stated at the foot of p. 431, of all the female wage-earners in the manufactures of Canada, over 49 p.c. found employment in the textile industries.

**Average Earnings in the Forty Leading Industries.**—Table 20 shows employees by sex and average salaries and wages paid in the forty leading industries during 1937, together with average salaries and wages paid in 1936. The rank of each industry is based on the aggregate salaries and wages paid.

In only ten industries did the average salaries exceed \$2,000; in seven they ranged from \$1,800 to \$2,000; in fourteen they ranged from \$1,500 to \$1,800; while in the remaining nine they were below \$1,500. The lowest salaries were reported by the sawmilling, butter and cheese, and bread and other bakery products industries which include a large proportion of small establishments.

The highest wages, those above \$1,250, were paid in eight industries—non-ferrous metal smelting and refining, \$1,459; petroleum products, \$1,451; automobiles, \$1,371; coke and gas products, \$1,368; pulp and paper, \$1,344; printing and publishing, \$1,338; primary iron and steel, \$1,333; railway rolling-stock, \$1,300—in all of which the proportion of skilled workers is probably high. In nine others average wages ranged from \$1,000 to \$1,250. In most of these seventeen industries the proportion of women workers is low. In ten other industries average wages ranged between \$800 and \$1,000, while in the remaining thirteen they were below \$800. This last group includes seasonal industries, such as fruit and vegetable canning, fish curing and packing, and industries that contain a large number of small units in which the work is intermittent, such as feed mills. Other industries with low average wages were: textiles, tobacco, and boots and shoes, in which the proportion of female wage-earners is high, in some cases over 50 p.c.

**20.—Statistics of Salaries and Wages Paid in the Forty Leading Industries, 1937, together with Comparative Figures of Average Salaries and Wages Paid in 1936, and Totals and Averages Paid in Previous Representative Years.**

The averages of wage-earners and earnings for the years 1931 to 1937 are strictly comparable with those for the years up to 1925 but not with those for the intervening years. The figures for the latest years—as for the earliest—represent the earnings for complete man-years of work, with no allowance for periods of unemployment. The difference amounts only to about 3 or 4 p.c. in the total figures and affects chiefly the seasonal industries.

**Real Earnings of Employees in Recent Years.**—When the index number representing the average yearly wages, with 1917 as a base, is divided by the index number of the cost of living, converted to the same base, it is seen that real wages advanced by 30·4 p.c. between 1917 and 1936. Index numbers for 1931 to 1937 are given in Table 21. In 1931 real wages reached 119·1, declined to 112·7 in 1933 and rose again to 130·4 in 1937, the highest on record.

**21.—Average Yearly Earnings, and Index Numbers of Earnings, Cost of Living and Real Wages of Wage-Earners, in Manufacturing Industries, 1931-37.**

NOTE.—Figures, with qualifications as to comparability, for 1917 to 1930 were published at p. 421 of the 1939 Year Book.

**Percentages of Salaries and Wages to Net Value of Products.**—Table 22 shows the relation between salaries and wages paid by manufacturers and the total net value of production. Figures of gross production are often used in such calculations, but the values out of which the wages of employees must come in the long run are the values added to the raw materials while they are in the factory. Such added values constitute the real production of the manufacturing plant and are alone available for payment of salaries and wages, interest, rent and taxes, repairs, and all other overhead charges that ordinarily must be met. The percentage of salaries was highest in the years 1931 to 1937. These were years in which manufacturing production was curtailed and it is probable that, salaried employees being a part of the organization of an industry rather than of its productive force, salaries were an abnormally high percentage of the lower levels of production then prevailing. The percentage declined steadily with the increasing manufacturing production maintained during the period 1924 to 1929, while from 1931 to 1937, due to decreased industrial activity, the percentage of salaries to value added was abnormally high. It should be borne in mind, however, that salaried employees increased 65·4 p.c. during the period 1924-37 while wage-earners increased but 30·4 p.c. The percentage of wages has fluctuated much less than that of salaries. The number of wage-earning employees may be more rapidly adjusted to the activity of the industry and wage levels likewise more readily adjusted to the price levels of the products. The percentage of wages to the values added by manufacture was thus only 2·8 p.c. lower in 1937 than in 1924. The percentage was highest in 1920, when, in the post-war inflation, average wages were highest and the efficiency of production lowest.

In previous reports on manufactures the percentage of salaries and wages paid to the value added by manufacture was carried back to 1917. Under the new method of calculating the value added, whereby the cost of materials plus fuel and electricity is deducted from gross values, it is possible to go back to 1924 only.

**Subsection 4.—Size of Manufacturing Establishments.**

A modern characteristic of industry in all industrial countries has been the increase in the size of the typical manufacturing establishment. Full utilization of highly specialized machinery has necessitated large-scale production, while improvements in transportation have widened markets.

The size of the manufacturing establishment is generally measured either by the value of product, or by the number of employees, but each of these methods has its limitations. The latter takes no account of the differences in capital equipment at different times or in various industries and obviously the increased use of machinery, as in the flour-milling industry, may lead to an increase in production concurrently with a decrease in number of employees. The former measure has to be adjusted for changes in the price level; and, as between industries, it makes those in which the cost of raw materials is relatively high, appear to operate on a larger scale. Both measures depend on the fluctuation of business activity and the demand of the consumer; over any lengthy period of time there is also the difficulty of comparability resulting from changes in the method of the census.

**Size as Measured by Gross Value of Products.**—While in 1922 the 420 establishments each producing over \$1,000,000 had an aggregate value of products of \$1,268,056,129 or 51 p. c. of the total production of all manufacturing industries, the 719 establishments producing over \$1,000,000 each in 1929 had an aggregate value of products of \$2,516,064,954, or 62 p. c. of the grand total for all manufacturing establishments—a very significant change in the short period of eight years. In 1931, however, the number of plants with a production of over \$1,000,000 dropped again to 482, their output being valued at \$1,451,658,954 or 53 p. c., of the total. Owing to the elimination of central electric stations, the figures since 1932 are not directly comparable with those for 1929 or 1922.

<sup>1</sup>Figures for this year include the production of central electric stations and the dyeing, cleaning and laundry industry. <sup>2</sup>Figures for this year exclude central electric stations and the dyeing, cleaning and laundry industry.

**Size of Establishments as Measured by Number of Employees.**—In 1923, establishments employing 501 hands or over accounted for 21.4 p.c. of the total number of employees engaged in manufacturing. By 1929 the proportion had increased to 27.3 p.c. of the total, thereby showing the increasing concentration of production into larger units. This tendency, however, was checked by the depression, the percentage having dropped in 1933 to 20.5 p.c. (central electric stations included). With the recovery in production since 1933 the percentage has risen again and in 1937 stood at 27.1 p.c. The same also holds true for all establishments employing 101 hands or over. In 1923 they employed 58.6 p.c. of the total, in 1929, 61.9 p.c., in 1933, 55.7 p.c., and in 1937, 62.8 p.c.

**Size of Establishments of Some of the Leading Industries.**—The following statement and Table 25 show the degree of concentration in some of the leading industries in Canada. Concentration is extremely marked in the cases of non-ferrous metal smelting, automobiles, pulp and paper, petroleum products, railway rolling-stock, slaughtering and meat packing, and rubber goods, whereas in the cases of men's and women's factory clothing, bread and bakery products, and butter and cheese, the degree of concentration is low. With regard to flour and feed mills, concentration is marked in the case of flour mills, but the small size of the average feed mill offsets this for the industry as a whole.

PERCENTAGE IMPORTANCE OF ESTABLISHMENTS, EACH WITH A GROSS PRODUCTION OF \$1,000,000 OR OVER, IN THE TWENTY-FIVE LEADING INDUSTRIES, 1937.

NOTE.—For principal statistics of these industries, see Table 12, p. 426.

Industry.	Number of Such Establishments.	Percentage to Total Number in the Industry.	Percentage of Total Production in the Industry.
1 Non-ferrous metal smelting and refining.....	14	100.0	100.0
2 Pulp and paper.....	58	59.2	93.7
3 Slaughtering and meat packing.....	36	26.1	91.1
4 Automobiles.....	7	46.7	98.5
5 Flour and feed mills.....	24	2.2	70.2
6 Butter and cheese.....	12	0.5	14.6
7 Sawmills.....	17	0.4	27.7
8 Electrical apparatus and supplies.....	17	8.9	79.0
9 Petroleum products.....	14	24.6	92.5
10 Railway rolling-stock.....	19	51.4	92.1
11 Bread and other bakery products.....	7	0.2	14.9
12 Primary iron and steel.....	15	27.3	85.9
13 Rubber goods, including rubber footwear.....	16	32.0	90.4
14 Cotton yarn and cloth.....	21	58.3	89.0
15 Printing and publishing.....	14	1.8	50.8
16 Clothing, women's factory.....	3	0.5	7.1
17 Machinery.....	9	4.2	43.9
18 Hosiery and knitted goods.....	13	7.6	36.0
19 Fruit and vegetable preparations.....	5	1.4	30.3
20 Biscuits, confectionery, cocoa, etc.....	14	6.3	57.6
21 Sheet metal products.....	12	8.1	55.2
22 Automobile supplies.....	11	12.5	73.9
23 Clothing, men's factory.....	6	3.0	24.6
24 Tobacco, cigars, and cigarettes.....	8	8.6	89.2
25 Breweries.....	11	16.9	57.4

**25.—Principal Statistics of the Twenty-Five Leading Industries of Canada, Grouped According to Size of Establishment (Gross Production per Unit), 1937.**

NOTE.—For principal statistics of the manufacturing industries in each province by size of establishment, see Table 2 of Part II, p. 455.

# GROWTH OF MANUFACTURING IN CANADA

## PURPOSE CLASSIFICATION 1938

## PART II.—PROVINCIAL AND LOCAL DISTRIBUTION OF MANUFACTURING PRODUCTION.

Ontario and Quebec are the most important manufacturing provinces of Canada. Their combined production in 1937 amounted to \$2,927,000,000 or over 80 p.c. of the gross value of manufactured products of the Dominion. The proximity of Ontario to the coalfields of Pennsylvania, the water power and other varied resources of the two provinces, and their nearness to the larger markets of Canada and the United States have all contributed to the above result. British Columbia had in 1937 the third largest gross manufacturing production with 7.0 p.c. of the total, and Manitoba the fourth with 4.0 p.c.; Alberta, Nova Scotia, New Brunswick, Saskatchewan, and Prince Edward Island followed in the order named.

Table 1 gives the gross value of manufacturing production in 1937 by provinces, groups, and individual industries. The outstanding predominance of Ontario and Quebec is shown in each group. The standing of these two provinces is most nearly approached by British Columbia in the case of the wood and paper products

<sup>1</sup> Included with "All other industries", since there are fewer than three establishments in the province. The amount for this item, however, is included in the total for Canada.

<sup>2</sup> See footnote 1.

group, where the latter province accounts for 16.0 p.c. of the gross production compared with 39.0 p.c. for Ontario and 32.1 p.c. for Quebec; in each of the other groups the positions of Ontario and Quebec lead by a wide margin.

Table 2 analyses the principal statistics of manufacturing in each province, by size of establishment. The picture here given reflects, in outline, the same general conclusion as Table 1. British Columbia, the third manufacturing province, has, in point of size, 41 establishments with individual gross production of over \$1,000,000, compared with 305 for Ontario, 177 for Quebec, 22 for Manitoba, 18 for Alberta, 13 for Nova Scotia, 12 for New Brunswick, and 9 for Saskatchewan. Capital investment, employees, and other factors show variation, in proportion to the size of establishment and according to the nature of the industry concerned (the 3 in Manitoba with production of over \$5,000,000 for instance, employ over five times as many persons as the 3 in the same class in Saskatchewan, and the 4 in the same class in British Columbia employ over thirteen times as many on the average as the 3 in Saskatchewan), but in a broad way the factor of size is reflected throughout the statistics.

## Section 1.—The Manufactures of the Maritime Provinces, 1937.

In Prince Edward Island the predominant agricultural and fishery resources make butter and cheese, fish curing and packing, and foods, stock and poultry the leading manufactures of the Province. Nova Scotia is renowned for its coal mines and its fisheries, but it has also extensive forests and agricultural lands and is favoured with easy access by sea to the high-grade iron ore supply of Newfoundland. These resources give rise to its leading manufactures of primary iron and steel, railway rolling-stock, fish curing and packing, pulp and paper, saw-mills, and butter and cheese. The forests of New Brunswick give a leading place to its pulp and paper and sawmilling industries, although manufactures of fish and agricultural products add to the varied output of the Province.

<sup>1</sup>Net value is derived from gross value by deducting cost of materials, fuel, and electricity.<sup>2</sup>Individual statistics cannot be given because there are fewer than three establishments in each industry. Such industries are: in Prince Edward Island, cotton and jute bags, slaughtering and meat packing, and fertilizers; in Nova Scotia, sugar refineries, cotton yarn and cloth, wire and wire goods, coke and gas, and petroleum products; in New Brunswick, sugar refineries, railway rolling-stock, and cotton yarn and cloth.

## Section 2.—The Manufactures of Quebec, 1937.

Among the assets of Quebec, which have tended to develop manufacturing industries in the Province, may be mentioned its natural resources of forests, water powers, minerals, and agricultural lands, and also its geographic position astride the St. Lawrence estuary permitting sea-going shipping to reach its main centres of population. Added to these natural advantages, there is a stable and industrious population, which is an important factor in industries such as textiles, clothing, boots and shoes, etc., where a large labour force is required.

The most notable change among the manufactures of Quebec in recent years has been the development of the non-ferrous metal smelting industry. This industry first appeared among the forty leading industries of the Province in nineteenth place in 1927; it was in second place in 1935, 1936 and 1937. The petroleum-refining industry has also expanded and risen in importance during the same period.

The importance of the pulp and paper industry in Quebec is shown by comparison with the industry throughout Canada. The Quebec section of the industry, in addition to supplying over 10 p.c. of the total gross value of all products manufactured in the province, furnished 47 p.c. of the products of pulp and paper mills throughout the country. The gross value of cotton yarn and cloth products from Quebec mills formed 69 p.c., the value of railway rolling-stock 48 p.c., the value of tobacco, cigars, and cigarettes 85 p.c., and the value of boots and shoes 61 p.c. of the Dominion totals for these products.

### Section 3.—The Manufactures of Ontario, 1937.

The gross value of the manufactured products of Ontario in 1937 represented about 52 p.c. of the total for the whole Dominion, while that of Quebec amounted to about 29 p.c. This premier position in manufacturing has been fairly uniformly maintained by Ontario, as the following percentages show: in 1926, 52 p.c.; 1918, 53 p.c.; 1910, 50 p.c.; 1900, 50 p.c., 1890, 51 p.c.; and 1880, 51 p.c. In spite of the rapid industrial development in recent years in other provinces, such as Quebec, British Columbia, and Manitoba, Ontario is maintaining a manufacturing production roughly equal to that of the remainder of the Dominion.

The geographic position of Ontario on the Great Lakes waterway system, by means of which the iron ore of Minnesota and the coal of Pennsylvania are readily accessible, has resulted in a greater development of the iron and steel industries in this Province than in any other. The Province is endowed with a wide range of natural resources of forests, minerals, water powers, and agriculture. Its large population and central position in Canada, with excellent water and rail transportation facilities to other parts of the country, have encouraged industrial development. Other factors in this development have been proximity to one of the most densely populated sections of the United States and the establishment within the Province of branch factories of United States industries, as in automobile manufacturing.

The depression was particularly hard on industries producing capital or durable goods, and these constitute an important factor in the manufactures of Ontario. Thus, production was disproportionately curtailed in such important industries as automobiles, electrical equipment, machinery, agricultural implements, primary iron and steel, etc. This resulted in a lowering of the manufacturing production of the whole Province relatively to that of other provinces less affected by these influences. Since 1933, however, these industries in general have made good recovery, and Ontario, which accounted for 49 p.c. of the gross value of all products manufactured in the Dominion in 1933, had by 1937 increased the relative value to 51.9 p.c.

Outstanding among industries in which Ontario was pre-eminent, was that of automobile manufacturing, which was carried on practically in this Province alone. Other important industries in which the Province led, with the percentage which the production of each bore to that of the Dominion in 1937, were as follows; agricultural implements, 95 p.c.; leather tanneries, 88 p.c.; rubber goods, 82 p.c.; furniture, 60 p.c.; fruit and vegetable canning, preserving, etc., 69 p.c.; electrical apparatus and supplies, 75 p.c.; castings and forgings, 64 p.c.; primary iron and steel, 62 p.c.; slaughtering and meat packing, 42 p.c.; flour and feed mills, 53 p.c.; hosiery and knitted goods, 62 p.c.; sheet metal products, 60 p.c.; biscuits, confectionery, cocoa, and chocolate, 56 p.c.; coke and gas products, 56 p.c.; brass and copper products, 64 p.c.

## Section 4.—The Manufactures of the Prairie Provinces, 1937.

The leading industries of these Provinces are those based on their agricultural resources—their grain-growing, cattle-raising, and dairying areas. Next in importance, generally, are industries serving the resident population, such as bread and baking, printing and publishing, etc. The extensive railway services require large shops for the maintenance of rolling-stock. The widespread use of motor vehicles and power machinery on farms has given rise to petroleum refineries in each province. The greatly increased production of crude petroleum in Alberta seems likely to lead to further development of the refining industry. Manitoba, as the early commercial centre of the prairies, has had a greater industrial development than either of the other provinces. Its natural resources of accessible water powers, forests, and, more recently, minerals, have given rise to quite a diversification of industrial production.

Considering the three Provinces as an economic group, slaughtering and meat packing had the largest gross production in 1937, amounting to \$60,800,000, followed by flour milling with \$43,900,000, and butter and cheese with \$26,600,000. These three industries for the processing of the agricultural products of the Provinces accounted for 45 p.c. of their total manufacturing production.

<sup>1</sup>See footnote 1 to Table 3, p. 457. <sup>2</sup>Other leading industries, individual statistics of which cannot be given because there are fewer than three establishments in each industry, are: Manitoba, pulp and paper, coke and gas products, and non-ferrous metal smelting and refining; Saskatchewan, non-ferrous metal smelting and refining; Alberta, sugar refining, wood preservation, and malt and malt products. The statistics of the three industries of Alberta are included under the heading "All other leading industries".

## Section 5.—The Manufactures of British Columbia,\* 1937.

British Columbia was, in 1937, the third most important manufacturing province in the Dominion with 7.0 p.c. of the total production. The rich forests have given the wood industries a pre-eminence in the Province. Sawmilling, in 1937, accounted for 21 p.c. of the manufacturing production of the Province and for 51 p.c. of the total value of sawmill output in the Dominion. Further emphasizing the importance of the forests in the industrial life of the Province, the pulp and paper industry ranked second. Third in importance was fish curing and packing, based principally on the estuarial salmon fisheries. British Columbia accounted for 59 p.c. of the total production of this industry in Canada. The varied resources of the Province and its position on the Pacific Coast have resulted in a good deal of diversification in its manufactures.

\*Including Yukon.

### 7.—Statistics of the Leading Industries of the Province of British Columbia,<sup>1</sup> 1937.

Industry.	Estab-lish-ments.	Capital.	Em-ployees.	Salaries and Wages.	Cost of Materials.	Gross Value of Products. <sup>2</sup>

Percentages of leading industries to total of all industries.....	73.3	89.9	87.3	88.3	93.0	91.3

<sup>1</sup>Including Yukon. <sup>2</sup>See footnote 1 to Table 3, p. 457. <sup>3</sup>Includes other leading industries, statistics of which cannot be published because there are fewer than three establishments in each industry. Such industries are: condensed milk, sugar refineries, wood preservation, non-ferrous metal smelting and refining, bridge and structural steel.

## Section 6.—Manufacturing Industries in Cities and Towns.

The prosperity of most of the cities and towns of Canada, especially in the East, is intimately connected with their manufacturing industries, which provide employment for a large proportion of their gainfully occupied population. In the West the cities are more largely distributing centres, though manufactures are rapidly increasing there also.

Table 8, indicating the extent to which the manufacturing industries of Canada are concentrated in urban centres, shows by provinces the proportion of the gross manufacturing production contributed by cities and towns having a gross production of over \$1,000,000 each. In the more highly industrialized provinces of Ontario and Quebec such cities and towns accounted for over 90 p.c. of the total, while in the Maritime Provinces and British Columbia, where sawmilling, fish packing, and dairying are leading industries, the proportions fell to 66·9 p.c. and 53·7 p.c., respectively. In the Prairie Provinces manufacturing is confined largely to a few urban centres.

### 8.—Cities and Towns Each with a Gross Manufacturing Production of over \$1,000,000, Number of Establishments and Total Gross Production in such Cities and Towns as a Percentage of the Grand Total, by Provinces, 1937.

NOTE.—Statistics published in this table are in some cases higher than the figures published in Table 10, since, in the table below are included statistics of towns with less than three establishments and production of over \$1,000,000 each. It was not possible to publish this information in Table 10 without disclosing the operations of individual establishments.

Province.	Cities and Towns with a Gross Production of over \$1,000,000 each.	Establishments Reporting in Cities and Towns Producing over \$1,000,000 each.	Total Production in Cities and Towns Producing over \$1,000,000 each.	Total Production in Each Province.	Production in Cities and Towns as a Percentage of Total Production in Each Province.
	No.	No.	\$	\$	p.c.

# CHAPTER XV.—CONSTRUCTION.

## CONSPPECTUS.

	PAGE.		PAGE.
SECTION 1. GOVERNMENT AID TO HOUSING.	468	SECTION 3. CONTRACTS AWARDED AND	
SECTION 2. THE ANNUAL CENSUS OF		BUILDING PERMITS ISSUED.....	475
CONSTRUCTION.....	471		

The construction industry is necessarily subject to great fluctuations, being extremely susceptible to the effects of general economic influences and, in a country with the climatic conditions of Canada, having to combat the effects of seasonal factors. Improved methods of construction, however, now make possible the performance of a much greater volume of work in the winter season than was possible a few years ago.

In the present survey of conditions in the industry, the first Section deals with the aid extended by the Dominion Government under the national program; this is designed to cope with the shortage of housing consequent upon the curtailment of building operations during the depression years. The second Section shows statistics that cover the bulk of building and construction work actually completed to the end of 1938, and the third Section shows the value of construction contemplated, as shown by contracts awarded and building permits issued, to the end of 1939.

### Section 1.—Government Aid to Housing.

**Dominion Housing Act, 1935.**—Prior to August, 1938, loaning facilities to assist in the construction of new homes were provided under the Dominion Housing Act, 1935 (see pp. 473-474 of the 1938 Year Book). In 1938 more extensive facilities of a similar nature were provided under Part I of the National Housing Act as described below.

**National Housing Act.**—Administered by the Department of Finance, the National Housing Act, 1938, was passed with a twofold purpose in mind: (1) to assist in the improvement of housing conditions; and (2) to assist in the absorption of the unemployed by the stimulation of the construction and building material industries. The Act comprises three separate Parts.

PART I re-enacts the main features of the Dominion Housing Act, 1935, with important amendments designed to encourage the construction of low-cost houses and the extension of lending facilities to the smaller and more remote communities. Under wartime regulations made public the early part of December, 1939, and effective as of and from Jan. 1, 1940, loans are restricted to the financing of single-family dwellings. The maximum loan in respect of each house is also limited to \$4,000. The other features of Part I of the Act remain unchanged.

The Minister is empowered to make advances and pay expenses of administering this Part to the extent of \$20,000,000, less advances already made and administrative expenses already incurred under the Dominion Housing Act which amounted to approximately \$5,500,000. All loans are made through approved lending institutions. Loans may be for an amount not exceeding 80 p.c. of the lending value of the property. Where lending value is \$2,500 or less, and the house is being built for an owner-occupant, loans may be for an amount not exceeding 90 p.c.

of such lending value. The equity of at least 20 p.c. or 10 p.c., respectively, is to be provided by the borrower. Provision is also made for loans ranging between 70 p.c. and 80 p.c. when the lending value exceeds \$2,500, and for loans ranging between 50 p.c. and 90 p.c. when the lending value does not exceed \$2,500. The interest rate paid by the borrower on all loans made under Part I is 5 p.c. This is made possible by the fact that the Government advances one-quarter of the total mortgage money on an interest basis of 3 p.c. Loans are made for a period of 10 years subject to renewal for a further period of 10 years upon revaluation of the security and on conditions satisfactory to all parties concerned. Interest, principal, and taxes are payable in monthly instalments. Amortization of principal over 20 years is provided for, but more rapid amortization may be arranged to suit the borrower. Sound standards of construction are required.

<sup>1</sup> October to December only.

PART II of the National Housing Act is designed to assist local housing authorities, including limited dividend housing corporations, to provide decent, safe, and sanitary housing to be rented to families of low income who cannot afford the 'economic rental' for such accommodation (designated as 9½ p.c. of the cost of construction plus the taxes that would ordinarily be levied on the property by the municipality). The Dominion is authorized to make first mortgage loans to local housing authorities up to a maximum amount of \$30,000,000, but loans to any one municipality must not exceed the proportion of \$30,000,000 that the

population of the municipality bears to the total urban population of Canada, based on the 1931 Census. Loans of 80 p.c. of the cost of construction (including cost of land, building, architectural, and legal expenses, and any other expenses necessary to complete the project), but not exceeding \$2,400 per family unit, may be made to limited dividend housing corporations organized to construct, hold, and manage houses built as a low-rental housing project, and dividends on the shares of which are limited to 5 p.c. annually. Loans of 90 p.c. of the cost of construction, and not exceeding \$2,700 per family unit, may be made to other local housing authorities. Interest is at  $1\frac{3}{4}$  p.c. in the case of limited dividend corporations, and 2 p.c. for other local housing authorities. Payments are made half-yearly covering principal and interest so as to amortize the loan in approximately 35 years. The municipality must agree not to levy taxes in excess of 1 p.c. of the cost of construction. Loans to local authorities other than limited dividend housing corporations are to be guaranteed as to principal and interest by the government of the province concerned.

PART III of the Act originally authorized the Minister of Finance to pay, under certain conditions, a portion of the municipal taxes on new low-cost single-family houses commenced between June 1, 1938, and Dec. 31, 1940. In order to qualify, a house was required to be built for an owner's own occupancy, and to cost, complete, not more than \$4,000. The payments provided for were 100 p.c. of the general real estate and school taxes on the new house for the first year in which it was taxed, 50 p.c. the second year, and 25 p.c. the third year. These benefits became operative in any municipality only when such municipality co-operated, by passing a by-law, making available a reasonable number of lots at not more than \$50 per lot. Early in December, 1939, the final date for submitting by-laws was set at Dec. 31, 1939, and to that date 203 municipalities had qualified. The period during which construction on a new house might be commenced was also shortened making the benefits applicable only in respect of those houses upon which construction should be begun on or before May 30, 1940.

**The Government Home Improvement Plan.**—Although operative, by agreement between the Dominion Government and lending institutions, since Nov. 1, 1936, the Home Improvement Plan derives its legislative sanction from "An Act to Increase Employment by Encouraging the Repair of Rural and Urban Homes", assented to on Mar. 31, 1937. Its objectives are (1) to provide employment in the construction and related industries and (2) to assist in the improvement of housing conditions. The method adopted to stimulate the advance of money for home repair and improvement is a Government guarantee up to 15 p.c. of the aggregate amount loaned under the plan by each approved lending institution.

First sponsored by the National Employment Commission, the Plan is now administered by the Department of Finance. It provides for the making of loans by chartered banks and other approved lending institutions to owners of residential property (including farm buildings) for repairs, alterations, and additions (including built-in equipment) to urban and rural dwellings. Loans may be made up to a maximum of \$2,000 on any single-family house. In the case of a multiple-family dwelling the maximum amount that can be borrowed is \$1,000, plus \$1,000 for

each family unit provided for in the building when the repairs or improvements are completed. Loans of \$1,000 or less are required to be repaid within 3 years, and loans of more than \$1,000 within 5 years. Payment may be made in equal monthly instalments or in such other instalments as are adapted to the financial circumstances of the borrower. The maximum charge must not exceed a rate of discount of 3½ p.c. for a one-year loan, repayable in equal monthly instalments. This is equivalent to an effective interest rate of 6.32 p.c. and loans involving other terms are discounted at a rate to produce approximately the same effective interest rate.

The limit of the aggregate loans is \$50,000,000, and the limit of the Government's guarantee is therefore \$7,500,000.

## Section 2.—The Annual Census of Construction.

The annual Census of Construction undertaken by the Dominion Bureau of Statistics covers all construction, maintenance and repair work undertaken by contractors, builders, and public bodies (except the smaller municipalities) throughout Canada. It does not include maintenance and repair work on steam and electric railways, telegraph and telephone systems, and the lesser public utilities when such work is done by the employees of these concerns in the ordinary way: nor can it include a substantial amount of construction in the aggregate done by farmers and other individuals who might be otherwise unemployed, performing work on their own structures. It is doubtful whether a great deal of the work of railways and utilities is construction in the sense understood in the census: for instance, the routine "maintenance of way" expenditures, so far as they relate to inspection work, are not construction, although so far as they concern rebuilding of line for road-bed or structures they might be said to fall in that category.

The following statement shows the expenditures by steam and electric railways, telegraph and telephone systems. Most of the railway work is done by the railway employees but much of the telegraph and telephone work is done by contractors, consequently these total expenditures cannot be added to industrial construction performed by contractors without including duplications. Also, no data are available of the value of work done by farmers and others working on their own account. The statistics presented in Tables 3 to 6 are, therefore, necessarily limited as explained above.

EXPENDITURES BY STEAM AND ELECTRIC RAILWAYS, AND TELEGRAPH AND TELEPHONE SYSTEMS ON MAINTENANCE OF WAY AND STRUCTURES, AND MAINTENANCE OF EQUIPMENT, 1935-38.

**Industrial Statistics of Construction.\***—A census of construction was made by the Dominion Bureau of Statistics for 1934, but the basis of compilation was not standardized until 1935 so that with the completion of the 1938 figures comparable statistics are now available covering the years 1935-38. Summary statistics are given in Tables 3, 4, and 5.

No relationship exists between the total value of construction as shown in these tables, and the value of contracts awarded as indicated in Table 9 of Section 3, p. 475. In the latter case all values are included as soon as awards are made irrespective of whether the contract is completed or even begun in that year, whereas the tables below cover construction work carried on and actually performed in the calendar year.

\* Revised by F. I. Tanner, Chief, Construction Statistics Branch, Dominion Bureau of Statistics.

**3.—Principal Statistics of the Construction Industry in Canada, 1935-38.**

Item.	1935.	1936.	1937.	1938.
Firms reporting.....No.	7,689	9,976	10,855	12,964
Capital invested.....\$	158,471,916	164,322,276	176,971,223	184,200,541

Table 6 classifies the various types of construction carried out in 1938. The item "Trade Construction" covers such items as brick laying, carpentry, plumbing, heating, electrical work, etc., reported by contractors who confine themselves to a specific type of work. Details by provinces and more complete information on the industry than it is possible to include in the limited space available here, will be found in the Bureau's report on the construction industry for 1938.

### 6.—Description, Classification, and Value of Construction in Canada, 1938.

NOTE.—Comparable figures for 1935, 1936, and 1937 are given in the corresponding table of the 1937, 1938, and 1939 Year Books.

In Tables 7 and 8 the employment figures, shown on a monthly basis, reflect the fact that, while the industry is seasonal in nature, it is not as decidedly so as is sometimes thought; this is noted especially when the statistics for the period 1935-38 are studied. The month of highest employment in the industry as a whole, in 1938, was September with 173,184 wage-earners and the lowest was February with 67,738.

### 7.—Employment of Wage-Earners in the Construction Industry and Their Remuneration, by Groups and Months, 1938.

NOTE.—Comparable figures for 1935, 1936, and 1937 are given in the corresponding table of the 1937, 1938, and 1939 Year Books.

### Section 3.—Contracts Awarded and Building Permits Issued.

In this section barometric statistics are given of work actually in sight as contracts awarded and building permits. These figures are related to the figures of work performed during the year only so far as the work thus provided for is completed and duly reported in the Census of Construction. Further, values of contracts awarded, and especially of building permits, are estimates (more often under-estimates) of work to be done. Obviously, these statistics and those of Section 1, cannot be expected to agree, since much work contracted for towards the end of any one year is often not commenced until the next and, especially as regards big contracts, extends into more than one year. The figures here given are, therefore, supplementary to those of Section 2 and are valuable as showing from year to year the work immediately contemplated during the period.

Over the period 1911-39, inclusive, or since the beginning of MacLean's record of construction contracts awarded as shown in Table 9, there has been an average annual per capita expenditure on construction of about \$28. The period covered includes, of course, the war years of 1915-18 and the depression since 1930, as well as the booms of 1911-13 and 1926-30. This average, consequently, is not unreasonably high. For the present population, the annual total of construction, on the basis of this average, should amount to about \$317,000,000. Furthermore, there is undoubtedly an accumulated deficiency in construction from the recent years of subnormal activity. Some idea may be gained, therefore, of the part that the normal functioning of the construction industry might play in the reduction of unemployment.

### 9.—Values of Construction Contracts Awarded in Canada, 1911-39.

(From MacLean Building Reports, Ltd.)

Year.	Value of Construction Contracts.	Year.	Value of Construction Contracts.	Year.	Value of Construction Contracts.
	\$		\$		\$
1911.....	345,425,000	1921.....	240,133,300	1931.....	315,482,000
1912.....	463,083,000	1922.....	331,843,800	1932.....	132,872,400
1913.....	384,157,000	1923.....	314,254,300	1933.....	97,289,800
1914.....	241,952,000	1924.....	276,261,100	1934.....	125,811,500
1915.....	83,916,000	1925.....	297,973,000	1935.....	160,305,000
1916.....	99,311,000	1926.....	372,947,900	1936.....	162,588,000
1917.....	84,841,000	1927.....	418,951,600	1937.....	224,056,700
1918.....	99,842,000	1928.....	472,032,600	1938.....	187,277,900
1919.....	190,028,000	1929.....	576,651,800	1939.....	187,178,500
1920.....	255,605,000	1930.....	456,999,600		

Engineering contracts accounted for 22.5 p.c. of the total value of the contracts awarded in 1939, residential buildings for 36.0 p.c., industrial buildings for 12.2 p.c., and business buildings for 29.3 p.c. As compared with 1938, residential building showed an increase of 22.6 p.c. in value, and industrial construction of 42.3 p.c., while engineering projects decreased 20.6 p.c. and business construction 13.2 p.c.

**Building Permits.**—The estimated value of construction in 58 cities of Canada, as indicated by their building permits, is shown for the years 1934 to 1939, inclusive, in Table 11. These cities had, in 1931, about 36 p.c. of the population of Canada while their 1939 building permits aggregated 32.2 p.c. of the total contracts awarded, as shown in Table 9.

Owing to the increasing use of the automobile and other means of rapid transportation, a growing percentage of those who work in the cities reside outside the municipal boundaries. Hence arises, in part, the necessity for an extension of the record of building permits to include such suburban areas as the York Townships in the case of Toronto, and North Vancouver in the case of Vancouver.

The construction contracts in 1939 as shown in Table 10 declined by 0.05 p.c. compared with 1938, while the building permits of 58 cities in Table 11 decreased by 0.9 p.c.

The indexes given in Table 12 show as far as possible the fluctuations in building costs with their effect upon construction work and employment. At various times attempts have been made to determine the relative proportions of material and wage costs in general building; such proportions vary with the type of building and the centres studied, and accurate and representative data are difficult to obtain. However, the results of a survey made in 1934 and published in *Building in Canada* (June, 1934) showed that in fifteen cities the average proportions in all types of construction were 63·6 p.c. for materials and 36·4 p.c. for labour. The reduction in the cost of building operations in the depression years has probably been much more than is indicated by the declines in the indexes of wholesale prices and wages from the relatively high averages shown since the War of 1914-18.

<sup>2</sup> As reported by employers.

<sup>3</sup> Not available.

**Employment in Building Construction, 1939.**—The Dominion Bureau of Statistics makes current surveys of the employment afforded by industrial establishments normally employing 15 persons or over. The index of employment in building construction, calculated (1926 average=100) from data furnished by some 850 employers, averaged 62.1 in 1939; in 1938 the figure was 60.2, the same as in 1937. The 1939 index is the highest since 1931.

## Section 1.—The Development of Tariffs.

The development of tariffs as affecting Canada is here outlined under two divisions: first, a historical sketch showing phases in the growth of Canadian trade that have influenced tariff development; and second, the present tariff relationships with other countries. Owing to the limitations of space in the Year Book, it is impossible to go into detail with such an intricate matter as tariffs. It has therefore been necessary to adopt the policy of confining any detail regarding commodities and countries to tariff relationships at present in force, and to summarize as much as possible historical data and details of preceding tariffs, giving references where possible to those editions of the Year Book where extended treatments can be found.

### Subsection 1.—Historical Sketch of External Trade and Tariffs.

In the early history of the American Continent each of the European nations establishing settlements in the New World endeavoured to monopolize the commerce of its colonies, prohibited the ships of other nations from resorting to them, and prohibited its colonials from importing European goods from other countries, generally granting them, however, preferential treatment in its own market. In these circumstances the colonial wars in America were carried on, by Governments permeated by the mercantile spirit, for "ships, colonies, and commerce". Owing to this fact, wars resulting in the transfer of colonies from one European power to another involved great economic as well as political changes in the community so transferred. The traders who had previously controlled the trade between the Mother Country and its colony found their occupations gone, while new traders from the conquering State arrived to take over the import and export trade, which thereafter flowed in new channels, perhaps no more artificial than those that had previously existed.

Throughout the earlier part of the French *régime* in Canada, the foreign trade of the colony was in the hands of the monopolistic chartered companies, of which the Company of One Hundred Associates was the most notable. When its monopoly

was cancelled in 1663, the external trade of Canada still remained a preserve of the merchants of Old France. Upon the conquest of the country by the British, the French merchants, who had their offices in Quebec and Montreal, for the most part returned to France, and the trade of the Colony fell into the hands of the traders from England, Scotland, and New England, who had flocked into the country on the heels of the invading armies. Some of their descendants are still among the leading figures in Canadian import and export trade.

For the first sixty years of British rule, Canadian commerce was carried on almost exclusively with or through the United Kingdom, the merchants of New England complaining, after the American Revolution, of being shut out from the Canadian trade. The geographical juxtaposition of the United States to British North America was, however, a factor that could not be permanently ignored, and smuggling became more and more prevalent as settlement extended westward along the International Boundary. In 1822 the United Kingdom made large concessions to United States traders in respect of the Canadian trade. In 1846 she abolished the preferential treatment that she had given to Canadian wheat, and in 1860 all vestige of preference to colonial products disappeared from the British tariff. As a consequence, the colonies which, like Canada, Nova Scotia, and New Brunswick, were by this time enjoying responsible government, could no longer be refused the right to control their own commercial policy—a fact that was emphasized in an important report prepared in 1859 by the then Minister of Finance, (Sir) A. T. Galt, and forwarded to the British Government. This report declared that the responsibility of the Canadian Government must be to the Canadian people, more especially in matters of taxation (the greater part of the revenue being raised by customs duties), and that the Canadian Government must affirm the right of the Canadian Parliament to adjust the taxation of the people in the way it deemed best, even if this should happen to meet with the disapproval of the British Ministry. This doctrine remained unchallenged by the British Government and, coming at a time when all important parties in the United Kingdom had accepted free trade as a *fait accompli*, it facilitated the setting up in Canada of a protective tariff, designed to secure the establishment in Canada of manufacturing industries, at a time when British opinion desired that the colonies should concentrate their attention on the production of food and raw materials and import from the United Kingdom the manufactured commodities they required.

**The Abolition of Preference and the Reciprocity Treaty of 1854.**—The abolition of the British preference on Canadian wheat in 1846 brought about a depression in the flour-milling industry of Montreal and an ephemeral agitation for union with the United States. The effects of the repeal of the preference were, however, mitigated in 1849 by the repeal of the Navigation Acts and the consequent opening of the carrying trade between Canada and the United Kingdom to the shipping of the world. Meanwhile, the abandonment of protection in the Mother Country led to the initiation of negotiations for a reciprocity treaty with the United States. A treaty for the free exchange of natural products between them and the British North American colonies was negotiated in 1854, and became effective on Mar. 16, 1855. From its operation the Canadian farmer and fisherman derived considerable benefit, more especially during the period of the Civil War, when prices in the United States were particularly high. Partly as a consequence of the friction between the United Kingdom and the United States during the Civil War period, and partly because the new Canadian tariff of 1859 shut out the manufactured goods

of the United States, the treaty was denounced by the United States at the end of the ten-year period for which it had been negotiated and ceased to operate 12 months later on Mar. 17, 1866. The denunciation of the treaty had a considerable effect in bringing about the confederation of the British North American colonies, which, it was hoped, would to a great extent consume each other's products.

**Tariff Policy since Confederation.**—The immediate effect of Confederation was to abolish the tariff barriers that existed between the provinces entering the Dominion. As the area of Canada increased until, except for Newfoundland and Labrador, it became conterminous with British North America, the area of internal free trade was thereby extended, while protection against outside competition was generally maintained. However, the protective tariff of the old Province of Canada, adopted in 1859 with a prevailing rate of 20 p.c., was replaced in 1866 by a tariff assimilated to the revenue tariffs of the Maritime Provinces, with the rates of duties on the great bulk of manufactured commodities reduced from 20 and 25 p.c. to 15 p.c. Later on, the world-wide depression that commenced in 1873, and the consequent falling-off in a revenue based upon trade, necessitated an increase of the general rate to  $17\frac{1}{2}$  p.c., with a 20 p.c. rate on certain luxuries. Even this increase failed to fill the treasury.

In 1879, after the people had declared for a protective policy in the general election of 1878, the duties on imported manufactured goods were considerably increased, the rate on goods "not otherwise provided" being raised from  $17\frac{1}{2}$  p.c. to 20 p.c., the rates on cotton goods from  $17\frac{1}{2}$  p.c. to rates, specific and *ad valorem* equivalent, on the importations of 1881, to 30 p.c., while the duties on woollens were practically doubled. The rate on furniture and clocks was increased to 35 p.c.; on carriages, glassware, wallpaper, and silks, to 30 p.c.; on boots and shoes, buttons, rubber goods, and woodenware, to 25 p.c. Pig-iron, previously free, now paid \$2 a ton, and the duty on iron billets, bars and rods was increased from 5 p.c. to 10 and  $17\frac{1}{2}$  p.c., while manufactured iron and steel products and machinery were given 25 to 35 p.c. protection. Throughout the '80's the general trend of the minor revisions made in the tariff was still upwards, but in the '90's a downward tendency became manifest. In 1891 the duty on raw sugar was repealed, and in 1894 material reductions were made on agricultural implements and minor readjustments on cottons and woollens. This period was also marked by the thorough-going extension of protection to the iron and steel industry, both by customs duties and bounties.

In the tariff revision of 1897, the duties on Indian corn, binder twine, barbed wire, pig-iron, flour, and refined sugar were reduced or abolished, while the bounties on domestic pig-iron were not reduced but in certain cases increased. But the most distinctive feature of the tariff revision of 1897 was the adoption of what was called a "reciprocal" tariff, one-eighth lower than the general. This reciprocal tariff was at once applied to the United Kingdom, and afterwards to New South Wales and to British India. Belgium and Germany, in virtue of their trade treaties with the United Kingdom, were also admitted to the benefits of the reciprocal tariff, together with Argentina, Austria-Hungary, Bolivia, Colombia, Denmark, Persia, Russia, Sweden, Switzerland, Tunisia, and Venezuela, on account of most-favoured-nation treaties between these countries and the United Kingdom, also France and her colonies, in consequence of the Franco-Canadian treaty of 1893. A little later the reciprocal tariff was also extended to the Netherlands, Japan, Siberia, Morocco, Salvador, South African Republic, Tonga, and Spain under most-favoured-nation treaties between these countries and the United Kingdom.

The numerous concessions mentioned above were, however, of a merely temporary character, ceasing to exist in 1898 as a consequence of the denunciation by the United Kingdom of her most-favoured-nation treaties with Germany and Belgium. This left Canada free to confine her lower tariff rates to the United Kingdom and to sister Dominions and colonies. A British preferential tariff, consisting at first of a remission of 25 p.c. of the duty ordinarily paid (Aug. 1, 1898), and later of a remission of  $33\frac{1}{3}$  p.c. of the ordinary rate of duty (July 1, 1900), was established. This method of preference was abandoned in 1904 for a specially low rate of duty on almost all imported dutiable commodities.

### Subsection 2.—Tariff Relationships with Other Countries.\*

Tariff relations between Canada and other countries are governed by: (1) application to Canada of some old commercial treaties of Great Britain; (2) participation in commercial treaties of Great Britain by Canadian Acts of Parliament; (3) Canadian Conventions of Commerce or Trade Agreements; (4) Exchange of Notes respecting reciprocal tariff concessions; (5) British preferential rates granted by the Tariff Act; (6) power of extending, by Orders in Council, British preferential or lower rates, intermediate rates, or other reduced duties as compensation for concessions received; (7) authority to impose a surtax on goods from a foreign country whose tariff discriminates against Canadian goods.

### EMPIRE COUNTRIES.

**Empire Preferences.**—The Tariff Act assented to June 13, 1898, by which Canada replaced the Reciprocal Tariff of the year before by a purely British Preferential Tariff, specifically granted the benefit of the new preferential duties to the United Kingdom, Bermuda, British West Indies, and British Guiana. A provision whereby the benefit could be extended to any British possession whose tariff was equally favourable to Canada was at once invoked to give the preferences to British India, Ceylon, Straits Settlements, and New South Wales. In 1904 these preferences were extended to New Zealand, to the colonies now comprising the Union of South Africa, and to Southern Rhodesia, all of which, about that time, had granted newly introduced preferences to Canada. All these countries, except New South Wales, which had ceased to be a separate customs area, were named in the Tariff Act of Apr. 12, 1907 (still in force, in amended form), as being entitled to British preferential rates. The British preference margin, which had been increased in 1900 from one-quarter to one-third, remained at approximately one-third in the 1907 revision, but has since been much varied and enlarged. The 1907 Tariff contains three columns—British Preferential, Intermediate, and General. Sect. 4 of the Tariff Act empowers the Governor in Council to extend British preferential rates, intermediate rates in whole or in part, or most-favoured-foreign-nation treatment to any part of the Empire or British mandated territories.

British preference has been extended to many new areas under Sect. 4. (See p. 520 of the 1934-35 Year Book.) The year 1937 witnessed its further extension (Order in Council Sept. 29, 1937) to Malta, Gilbert and Ellice Islands, British Solomon Islands Protectorate, Nauru, Papua, and Norfolk Island. The Intermediate Tariff was extended to Hong Kong as from Feb. 4, 1933. Orders in Council were passed that accorded most-favoured-foreign-nation treatment to the United

\* Revised by W. Gilchrist, Chief, Foreign Tariffs Division, Department of Trade and Commerce.

Kingdom and the Union of South Africa on July 19, 1935; to Australia and New Zealand on Aug. 21, 1935; to the British West Indies on Oct. 20, 1936; to all the non-self-governing British colonies and protectorates, Palestine, Tanganyika territory, and the territories of Togoland and Cameroons under British Mandate on Sept. 29, 1937. Ireland (Eire) is similarly favoured because of the fact that her Trade Agreement with Canada guarantees to her duties as low as apply to the United Kingdom.

Either by means of the Tariff Act or Trade Agreements with the United Kingdom, Ireland, Australia, New Zealand, Union of South Africa, and British West Indies, Canada now accords her British Preferential Tariff, or lower rates, to almost the whole Empire, including British protectorates and mandated territories. In addition, the products of the Newfoundland fisheries are declared by Sect. 8 of the Tariff Act to be free of customs duty until otherwise determined by Order in Council.

Reciprocal concessions in Empire markets are widespread. Nearly all Canadian products are given tariff preferences when entering Great Britain and Northern Ireland, Australia, New Zealand, British West Indies, Bermuda, British Guiana, British Honduras, Fiji, Northern Rhodesia (Zambesi Basin), Gambia, Sierra Leone, Seychelles, British Somaliland, St. Helena, Western Samoa, British Protectorate of Tonga, British Solomon Islands, Gilbert and Ellice Islands, Cyprus, Channel Islands, and Isle of Man, while Southern Rhodesia, Mauritius, Ceylon, and Malta grant preference to most Canadian goods. To a considerable extent tariff preference is granted to Canadian goods in Ireland and Union of South Africa; also, on some goods, in the Federated and Unfederated Malay States, British North Borneo, Sarawak, Brunei, and Cayman Islands. Empire motor-cars enjoy preference in Hong Kong and the Straits Settlements; spirits, wines, malt liquors, and tobaccos in Gibraltar; and wines in the Falkland Islands.

**United Kingdom.**—Canada has granted to the United Kingdom her British Preferential Tariff since its inception in 1897. The United Kingdom, in 1919, introduced preferences for Canada and the rest of the Empire on the limited number of products then comprising her tariff. In subsequent years, with expansion of the tariff, Empire preferences in the United Kingdom extended to more commodities. (See pp. 521-522 of the 1934-35 Year Book.) The Import Duties Act, effective Mar. 1, 1932, imposed a duty of 10 p.c. *ad valorem* on all non-Empire goods not already dutiable or specifically exempted. On the report of an Advisory Committee created by the Act the general rate was increased within two months on many manufactured articles to 15, 20, 25, 30, or 33½ p.c. Less comprehensive Orders issued from time to time have made further changes. The Act exempted products of the Colonial Empire altogether and exempted products of the Dominions, India, and Southern Rhodesia until Nov. 15, 1932. A Trade Agreement between Canada and the United Kingdom signed on Aug. 20, 1932, extended the period of exemption of Canadian goods (see p. 486 of the 1936 Year Book) for five years. The 1932 Agreement was superseded by one signed Feb. 23, 1937, which renewed exemption of Canadian goods from the Import Duties Act, or any other duties not already applicable, with the qualification, as in the previous Agreement, that the United Kingdom, after notification, may impose duty (preferential) on Canadian eggs, poultry, butter, cheese, and other milk products, or in consultation with the Canadian Government may regulate supplies. The United Kingdom granted specified preferences on Canadian wheat, copper, lead, zinc (conditional on Empire producers supplying the demand at world prices), butter, cheese, raw or canned apples, pears, eggs, processed milk, honey, fish, timber, asbestos, and patent leather. The preference margin on Canadian natural silk hosiery was increased, the rate on

motor-cars and parts stabilized, the duty on reed organs removed, and a fixed preference on tobacco assured until Aug. 19, 1942. Canada obtained the benefit of all British Preferential Tariffs in the Colonial Empire and also exchanged specific preferences with certain colonies. Canada conceded to the United Kingdom reduced duties under 179 tariff items, gave assurance of no upward revision of existing preferential rates under 246 items, and in the case of 91 items (mainly products of a class not made in Canada), undertook that margins of preference would not be reduced. (See p. 489 of the 1938 Year Book.) The 1937 Agreement was approved by the Canadian Parliament on Mar. 31, 1937, implemented by the United Kingdom Budget of Apr. 20, 1937, and formally proclaimed in force from Sept. 1, 1937. It is to remain in force until Aug. 20, 1940, and afterwards until terminated on six months' notice.

To facilitate conclusion of a United Kingdom-United States Trade Agreement signed Nov. 17, 1938, Canada, Australia, New Zealand, the Union of South Africa, Newfoundland, and India consented to certain modifications of their rights under their existing trade agreements with the United Kingdom, Canada agreeing to cancellation of the 3 pence per bushel preference on wheat, seasonal reduction of preference on apples and pears, and some reduction of preference on canned apples, honey, chilled or frozen salmon, certain timber, and patent leather, as well as to certain changes in Colonial preferences. Similarly, the United Kingdom and the Union of South Africa consented to modification of preferences guaranteed to them by Canada to facilitate a new trade agreement between Canada and the United States, also signed Nov. 17, 1938.

**Ireland.**—Ireland at its inception in 1923 as the Irish Free State, granted Canada any preferential rates in force, and in return received the benefit of the British Preferential Tariff. A formal Trade Agreement between Canada and Ireland, signed Aug. 20, 1932, secured for all goods, the produce and manufacture of Canada, the benefits of the lowest rates of duty accorded to similar products of any country. In return, goods, the produce or manufacture of Ireland, when imported into Canada, were to be accorded the same tariff treatment as similar goods imported from the United Kingdom.

**Australia.**—A Trade Agreement between Canada and Australia (superseding a 1925 arrangement of limited scope) was brought into force on Aug. 3, 1931. British Preferential Tariffs were exchanged, with some reservations by Australia, and some additional concessions by Canada. Enlarged margins of preference were also granted by each country on certain products of importance to the other. (See p. 484 of the 1936 Year Book.) The Agreement, which was obligatory for one year, has remained in force subject to six months' notice of denunciation by either Government. During the fiscal year 1936-37 Canada's exports to Australia reached \$27,000,000. Imports from Australia were \$9,500,000. In view of trade balances being so much in Canada's favour, the Australian Government had intimated that if the Agreement were to continue, further Canadian concessions should be accorded Australian products. After negotiations, the Canadian duties on certain Australian goods were reduced by Order in Council effective Oct. 1, 1937, and the Trade Agreement was kept in force, subject, as before, to denunciation on six months' notice by either Government.

**New Zealand.**—Canada was granted the British preferential rates of the New Zealand Tariff established in 1903. Canada has extended her British Preferential Tariff to New Zealand since 1904. On Oct. 1, 1925, Canadian special rates then

granted Australia were also extended to New Zealand, but withdrawn on Oct. 12, 1930. As from June 2, 1931, New Zealand cancelled nearly all her British preferential rates to Canada. On May 24, 1932, a new Trade Agreement was brought into force for one year (applicable also to Western Samoa and Cook Islands), whereby Canada granted New Zealand some rates lower than British preferential, and otherwise the British Preferential Tariff. New Zealand restored the British preferential rates to Canada except for 6 items upon which intermediate rates were conceded. A New Zealand surtax of  $22\frac{1}{2}$  p.c. of duty (in a few instances 5 p.c.) instituted on Aug. 18, 1930, was cancelled by a New Zealand tariff amendment of Nov. 19, 1932, as regards all Empire goods except those from Canada, Union of South Africa, Ireland, Newfoundland, and India. The 1932 Trade Agreement was made for one year, but has been kept in force by various renewals. A one-year renewal to Sept. 30, 1938, was effected by Canada granting further reductions in duty on some New Zealand products. Another renewal to Sept. 30, 1939, was arranged by Canada waiving exchange dumping duty on New Zealand butter and New Zealand undertaking to co-operate as far as possible by limiting shipments to proportions that would not unduly prejudice the interests of Canadian producers. A further renewal extended the agreement to Sept. 30, 1940, without any change in terms of the Agreement.

**Union of South Africa.**—In addition to the British Preferential Tariff, which Canada accords to the Union of South Africa under the Tariff Act of 1907, commerce with the Union of South Africa is governed by a Trade Agreement signed Aug. 20, 1932. It provides for exchange of preferential treatment on selected commodities. (See p. 487 of the 1936 Year Book.) By an Exchange of Notes (Union of South Africa dated Aug. 2, 1935; Canada dated Aug. 31, 1935) effective July 1, 1935, each Dominion assures the other of as low rates as apply to any foreign country.

**Southern Rhodesia.**—A Trade Agreement signed Aug. 20, 1932, exchanging preferences on a few selected commodities and each country's British Preferential Tariffs on nearly all other commodities, was terminated as from Jan. 2, 1938, on notice by Southern Rhodesia. Although the Trade Agreement was cancelled, Southern Rhodesia, under a new tariff of 331 items, adopted May 18, 1937, accords Canada and the United Kingdom the same preferences over foreign countries on 177 tariff items. On 78 items Canada has a rate intermediate between the United Kingdom and foreign countries. On 10 items Canada has no preference over foreign countries although the United Kingdom has preference. On the remaining 66 items the rates are the same to all countries. Canada, under the Tariff Act of 1907, applies her British Preferential Tariff to Southern Rhodesian goods.

**British West Indies.**—Under the Canadian Customs Tariff Act, 1907, the British Preferential Tariff applies to the British West Indies, Bermuda, and British Guiana, and by Order in Council effective Feb. 1, 1913, to British Honduras. Special tariff concessions were made to the British West Indies in a reciprocal Trade Agreement of 1912, enlarged in 1920. The latter was replaced on July 6, 1925, by an Agreement still more extensive and brought formally into force by proclamation as from Apr. 30, 1927, and binding for a 12-year period and thereafter until terminated, on a year's notice. It includes: Jamaica, Trinidad, Barbados, Bahamas, Leeward Islands, Windward Islands, Bermuda, British Guiana, and British Honduras. (For further details see p. 484 of the 1936 Year Book.) A Canadian notice involving revision of the 1925 Agreement in 1939 was replaced by one of Dec. 27, 1939, proposing continuance of the agreement subject to the right of either party to terminate it on six months' notice.

## FOREIGN COUNTRIES.

The power given under Sect. 4 of the Tariff Act to extend the Intermediate Tariff, in whole or in part, by Order in Council, to British countries, applies equally to foreign countries. Another important means of arranging for reciprocal concessions from foreign countries is afforded by Sect. 11 of the Customs Tariff which authorizes the making by Order in Council of such reductions of duties on goods imported into Canada from any other country as may be deemed reasonable by way of compensation for concessions granted by any such country. On the other hand, power is given under Sect. 7 to impose a surtax of  $33\frac{1}{3}$  p.c. *ad valorem* on goods from any foreign country that treats imports from Canada less favourably than those from other countries.

**Most-Favoured-Nation Treatment.**—Mutual guarantee of most-favoured-foreign-nation treatment, or, as it is commonly called, most-favoured-nation treatment, enters into many of the tariff arrangements between Canada and foreign countries. Usually, this means that Canada and the other contracting State agree that each party will accord to the goods of the other the benefit of the lowest duties applied to similar goods of any other foreign origin. There may be reservations. These reservations are likely to be tariff advantages, not relatively of far-reaching importance, such as one State may grant to another on historical, political, or geographical grounds, or some other special relationship. The concessions arising out of most-favoured-nation treatment under the Canadian tariff now consist of the rates of the Intermediate Tariff, and lower rates on some goods provided in Trade Agreements with France, the United States, and Poland. It will be seen that the guarantee by Canada of most-favoured-nation treatment to a foreign country does not entitle the foreign country to preferences existing only under the British Preferential Tariff or an Empire Trade Agreement. In other words, Empire preferences are confined within the Empire. On Apr. 26, 1939, a special 3 p.c. tax was cancelled, except as regards imports under the General Tariff, thus enlarging the benefit of most-favoured-nation treatment.

The benefit to Canadian exports of most-favoured-nation treatment in any country depends on the customs and treaty system of the particular importing country concerned. Several foreign nations have maximum and minimum schedules, meaning that there are two scales of duties for practically all goods imported. There may be also an intermediate scale of duties. Some countries maintain reduced duties only on specified items of their tariffs, which they have conceded in one or more commercial treaties. A country, too, may adhere strictly to a single-column tariff. Even when it makes concessions in a commercial treaty it may incorporate these in the normal tariff, thus discriminating against no country. The number of countries maintaining uniform tariffs regardless of the origin of goods, however, is becoming smaller from year to year. The benefit of most-favoured-nation treatment would, of course, depend also on the extent to which tariff favours apply to countries competing in the market in question. It has been the practice to include import restrictions when bargaining for most-favoured-nation treatment but the significance of this is greatly lessened in recent years by countries administering import quotas independently of most-favoured-nation commitments.

**Argentina.**—A Treaty of Amity, Commerce and Navigation between Great Britain and Argentina, signed Feb. 2, 1825, exchanging most-favoured-nation treatment is still applicable to the tariff relations between Canada and Argentina.

Argentine customs duties, with minor exceptions, apply equally to imports from all countries. Extensive tariff reductions made in an Agreement of Sept. 26, 1933, with the United Kingdom, have been extended to imports from all countries.

**Belgium.**—A Convention of Commerce between Canada and Belgium, signed July 3, 1924, provided for exchange of most-favoured-nation treatment of each other's goods. The Belgian Tariff consists of a Minimum Tariff and a Maximum Tariff (three times the minimum). The Minimum Tariff, however, is in practice applied equally to imports from all countries.

**Bolivia.**—Article 15 of the Treaty of Commerce of Aug. 1, 1911, between the United Kingdom and Bolivia, was accepted by Canadian Order in Council of July 20, 1935, the effect being an arrangement between Canada and Bolivia for exchange of most-favoured-nation treatment of each other's goods. Customs duties in Bolivia are applied equally to imports from all countries.

**Brazil.**—On account of Brazilian policy to cancel old Trade Agreements, an arrangement was made between Canada and Brazil by Exchange of Notes, July 25-30, 1936, granting the Canadian Intermediate Tariff for the Brazilian Minimum or lowest tariff. This arrangement continued the former reciprocal relationship between the two countries. It was superseded by an Exchange of Notes of June 12, 1937, providing for the mutual concession of most-favoured-nation treatment in tariff matters. The Tariff of Brazil consists mainly of a Minimum Tariff and a General Tariff, approximately one-quarter higher. Some rates lower than the minimum, established by an Agreement of Feb. 2, 1935, with the United States, apply to imports from countries enjoying most-favoured-nation treatment.

**Colombia.**—A Treaty of Friendship, Commerce and Navigation between the United Kingdom and Colombia, signed Feb. 16, 1866, requires Colombia and Canada to give each other most-favoured-nation treatment in tariff matters. Colombia, on Mar. 1, 1938, gave one year's notice of termination of this treaty, but Notes were exchanged on Dec. 30, 1938, continuing the Treaty in force until Sept. 30, 1939, and thereafter until terminated on three months' notice. An Agreement between Colombia and the United States, signed Sept. 13, 1935, created many reduced Colombian duties, to which treaty countries became entitled. Otherwise Colombian duties apply equally to imports from all countries.

**Costa Rica.**—A Costa Rican law of Feb. 16, 1933, established a surcharge of 30 p.c. of the duty on imports from countries not granting most-favoured-nation treatment to Costa Rica. Reduced duties appeared in an Agreement with the United States signed Nov. 28, 1936. An Exchange of Notes of Mar. 1-2, 1933, with the United Kingdom, set forth that Costa Rica would extend most-favoured-nation rates to any part of the British Empire on a reciprocal basis. A Canadian Order in Council of July 20, 1935, extended most-favoured-nation treatment to Costa Rica, thus entitling Canadian goods to a reciprocal concession in Costa Rica.

**Czechoslovakia.**—A Convention of Commerce between Canada and Czechoslovakia of Mar. 15, 1928, exchanged most-favoured-nation treatment in tariff matters. Czechoslovakia had conventional or reduced duties on many goods. The absorption by Germany of a large part of Czechoslovakia in March, 1939, and the outbreak of war in September, 1939, interfered with the operation of the Canada-Czechoslovakia Trade Agreement.

**Denmark.**—Danish Treaties of Peace and Commerce with Great Britain of Feb. 13, 1660-1, and July 11, 1670, establishing reciprocal most-favoured-nation

treatment of each other's goods, still apply to the tariff relations between Canada and Denmark. Although Denmark has a single-tariff schedule, which is applicable to all countries, provision is made for penalty duties against countries that discriminate against her.

**Dominican Republic.**—A Trade Agreement between Canada and the Dominican Republic, signed Mar. 8, 1940, and brought into force provisionally as from Mar. 15, 1940, provides for exchange of most-favoured-nation treatment in tariff matters. In addition, the Dominican Republic agreed to remove internal revenue taxes from imported Canadian dry salted hake, pollock and cusk, smoked herring, and other smoked fish. Canadian seed potatoes were made free of both customs duty and internal revenue tax. Continued entry of Canadian wheat free of internal revenue tax was also guaranteed.

**Estonia.**—Article 28 of the United Kingdom-Estonia Treaty of Commerce and Navigation of Jan. 18, 1926, providing means for a most-favoured-nation arrangement between Canada and Estonia, was accepted by the Canadian Trade Agreements Act of June 11, 1928. The duties of the Estonian Minimum Tariff are half those of the General Tariff, while on some goods conventional rates lower than the Minimum Tariff exist.

**Finland.**—Article 23 of the United Kingdom-Finland Treaty of Commerce and Navigation of Dec. 14, 1923, providing means for exchange of most-favoured-nation treatment between Canada and Finland, was accepted by the Finland Trade Agreement Act of June 12, 1925. Finland has in force some conventional rates lower than her General Tariff.

**France.**—The Franco-Canadian Trade Agreement of 1922 having lapsed on June 16, 1932, negotiations for a new Agreement ensued and were concluded by the signing of a Trade Agreement on May 12, 1933. This Agreement was brought into force as from June 10, 1933. Under its terms Canada was accorded the rates of the French Minimum Tariff and most-favoured-nation treatment on 185 items or parts of items and reductions varying from 17 p.c. to 73 p.c. of the General Tariff on 24 items or parts. The French General Tariff is, for most goods, four times the Minimum Tariff. Intermediate rates are expressed as varying percentage reductions from the General Tariff. In return Canada conceded to France a rate as low as British preferential on 7 items, reductions from the Intermediate Tariff of from 10 p.c. to 25 p.c. on 95 items, and Intermediate Tariff rates on an extensive list of items. The French colonies are included within the scope of the Agreement. The Agreement was supplemented by a Protocol of Feb. 26, 1935, and Notes exchanged Mar. 20, 1936, July 30, 1937, and Nov. 12-18, 1938, under which Canada secured the Minimum Tariff on 25 more items of the French Tariff, in return for adjustments of duty on some French products. These supplementary arrangements also made provision for quotas on many Canadian articles of which the import into France is subject to quantitative restrictions. The Canadian Intermediate Tariff was extended to France, her colonies and protectorates as from June 5, 1939.

**Germany.**—In the absence of a commercial agreement, a 'Super Tariff' (*Obertariff*) created by a German law of Jan. 18, 1932, two to four times as high as the General Tariff, on goods affected, was invoked against Canada on Apr. 1, 1932. On account of negotiations that ensued, the Super Tariff was suspended on July 1, 1932, for six months. By Exchange of Notes effective Jan. 1, 1933, an Agreement, for the duration of three months, was entered into, giving Germany the

Canadian Intermediate Tariff in return for its ordinary General Tariff and any existing conventional duties. This arrangement was renewed, first for nine months, and on Jan. 1, 1934, for an indefinite period, subject to termination on six months' notice. A Provisional Trade Agreement, including exchange of most-favoured-nation treatment and a payments agreement, on account of the control exercised by Germany over exchange for payment of goods, were entered into on Oct. 22, 1936 (see page 465 of the 1939 Year Book). An Order in Council (P.C. 2512) of Sept. 5, 1939, passed under the War Measures Act, brought into force regulations that prohibit trading with the enemy during the War. The enemy was defined as any State or sovereign of a State at war with His Majesty. Order in Council (P.C. 2586) of Sept. 8, 1939, relating to "apprehended state of war" specified the German Reich as an enemy State. In this way the Trade Agreements with Germany were automatically suspended.

**Guatemala.**—A Guatemalan law of Jan. 25, 1936 (renewing with slight changes a surtax law of Jan. 26, 1935), provided for increasing by 100 p.c. the customs duties on goods from countries whose trade balances are adverse to Guatemala and who had increased their exports to Guatemala by 100 p.c. or more in 1935 as compared with 1934. A Trade Agreement between Canada and Guatemala, signed Sept. 28, 1937, by exchange of most-favoured-nation treatment, exempted Canadian goods from the customs surcharge and entitled Canada to reduced duties provided for some items in a Guatemalan Agreement of Apr. 24, 1936, with the United States. Pending ratification of the Agreement, an Exchange of Notes on the same date established most-favoured-nation treatment reciprocally as from Oct. 14, 1937. A Canadian Act ratifying the Agreement was assented to on May 25, 1938. Ratifications were exchanged bringing the Agreement into force as from Jan. 14, 1939. It is drawn for three years and thereafter until terminated on six months' notice.

**Haiti.**—Haiti reduced duties on some United States products in a Trade Agreement of Mar. 28, 1935, and on Apr. 9, 1935, adopted a new Maximum Tariff (double the Minimum) which would have applied to Canada, if by Exchange of Notes of June 10, 1935 (renewed Apr. 6, 1936, and Apr. 15, 1937) Canada and Haiti had not exchanged most-favoured-nation treatment in tariff matters. A Canadian-Haiti Trade Agreement signed Apr. 23, 1937, and approved by a Canadian Act assented to on May 25, 1938, confirms this tariff arrangement. The Agreement is for one year and thereafter until terminated on six months' notice. Ratifications were exchanged bringing the Agreement into effect in both countries on Jan. 10, 1939.

**Hungary.**—Article 20 of the United Kingdom-Hungary Treaty of Commerce and Navigation of July 23, 1926, affording means for exchange of most-favoured-nation treatment in tariff matters between Canada and Hungary, was accepted by the Canadian Trade Agreements Act of June 11, 1928. Hungary has in force various conventional rates lower than her General Tariff, resulting from treaties with other countries.

**Italy.**—A Convention of Commerce between Canada and Italy of Jan. 4, 1923, provided for exchange of most-favoured-nation treatment in tariff matters. The General Tariff of Italy is applicable to imports from all countries except where reduced rates for many goods have been established by commercial treaties.

**Japan.**—A Treaty of Commerce and Navigation between the United Kingdom and Japan on a most-favoured-nation basis, signed Apr. 3, 1911, was accepted by Canada (with minor provisos) in an Act of Apr. 10, 1913. Certain surtaxes were imposed by Japan on July 20, 1935, and by Canada on Aug. 5, 1935, against each

other's goods. An Exchange of Notes on Dec. 26, 1935, effected the removal of the surtaxes by both countries and stated the basis for Canadian customs valuations on Japanese goods. (See p. 489 of the 1936 Year Book.)

**Latvia.**—Article 26 of the United Kingdom-Latvia Treaty of Commerce and Navigation of June 22, 1923, providing means for exchange of most-favoured-nation treatment in tariff matters between Canada and Latvia, was accepted by the Canadian Trade Agreements Act of June 11, 1928. Latvia has a minimum schedule of duties and a maximum schedule twice as high, as well as some rates of duty fixed by conventions with other countries.

**Lithuania.**—Article 4 of the United Kingdom-Lithuania Agreement of May 6, 1922, providing means for exchange of most-favoured-nation treatment in tariff matters between Canada and Lithuania, was accepted by the Canadian Trade Agreements Act of June 11, 1928. Lithuania has in force a Maximum Tariff on certain specified items double the Ordinary Tariff. There are rates lower than the Ordinary Tariff on a few items resulting from treaties.

**Netherlands.**—A Canadian-Netherlands Convention of Commerce of July 11, 1924, provided for exchange of most-favoured-nation treatment in tariff matters between Canada, Netherlands, Netherlands Indies, Surinam, and Curaçao. The Netherlands Tariff consists of a single schedule of duties, without tariff preference to any country.

**Norway.**—A Convention of Commerce and Navigation between the United Kingdom and Norway (and Sweden) of Mar. 18, 1826, is applicable to British territories to the extent of still providing exchange of most-favoured-nation treatment in tariff matters between Canada and Norway. Norway has a single-tariff schedule but there exist provisions for imposing penalty duties on non-reciprocating countries.

**Panama.**—Article 12 of a United Kingdom-Panama Treaty of Commerce and Navigation, signed Sept. 25, 1928, affording means for reciprocal most-favoured-nation relations with Panama, was accepted by Canadian Order in Council of July 20, 1935. A Canadian Order in Council of Dec. 29, 1936, conceded the Canadian Intermediate Tariff to the Panama Canal Zone. Duties in Panama apply equally to imports from all countries.

**Poland.**—A Convention of Commerce between Canada and Poland, signed July 3, 1935, effective Aug. 15, 1936, exchanged most-favoured-nation treatment and, as regards scheduled goods, granted reductions from the Canadian Intermediate Tariff and from the lowest Polish Tariff. The Polish Tariff comprises two columns of rates for all goods, the rates of Column I being about 25 p.c. higher than the rates of Column II. On some goods there are conventional rates resulting from trade treaties that Poland has concluded with other countries and that are lower even than the rates of Column II. The Free City of Danzig was declared party to the Convention from Jan. 1, 1937. The dismemberment of Poland and outbreak of war in September, 1939, interrupted trade under the terms of this Agreement.

**Portugal.**—Article 21 of the Treaty of Commerce and Navigation between the United Kingdom and Portugal, signed Aug. 12, 1914, providing for exchange of most-favoured-nation treatment in tariff matters, was accepted in the Canadian Trade Agreements Act of June 11, 1928. The Portuguese Tariff has maximum and minimum scales, the treaty arrangement securing the minimum for Canada.

**Roumania.**—Article 36 of the Treaty of Commerce and Navigation between the United Kingdom and Roumania of Aug. 6, 1930, affording means for exchange of most-favoured-nation treatment between Canada and Roumania, was utilized in

an Exchange of Notes of Sept. 30, 1930. Roumania has a Minimum Tariff on some commodities, one-third lower than her General Tariff, also, as a result of treaties, reductions from the Minimum Tariff on certain goods.

**Russia.**—A Canadian Order in Council of Feb. 27, 1931, prohibiting importation from the Union of Soviet Socialist Republics of coal, wood-pulp, pulpwood, lumber, asbestos, and dressed furs, was cancelled by an Order in Council of Sept. 10, 1936, in consequence of which the Soviet Union repealed an Order of Apr. 20, 1931, that had prevented her importing organizations and trade representatives from purchasing Canadian goods or chartering Canadian vessels.

**Salvador.**—By Exchange of Notes of Nov. 2, 1937, Canada and El Salvador granted each other most-favoured-nation treatment in tariff matters. The Tariff of El Salvador consists of a Maximum Tariff, a Minimum Tariff (one-third the Maximum) and some conventional rates lower than the Minimum.

**Spain.**—A Treaty of Commerce and Navigation between the United Kingdom and Spain, signed Oct. 31, 1922 (revised Apr. 5, 1927), providing for exchange of most-favoured-nation treatment in tariff matters, was accepted on behalf of Canada by the Spanish Treaty Act of June 11, 1928. The Tariff of Spain consists of a First Tariff (the highest), a Second Tariff (usually one-third of the First) and some conventional rates lower than the Second.

**Sweden.**—A Convention of Commerce and Navigation between the United Kingdom and Sweden (and Norway) of Mar. 18, 1826, had the effect of establishing most-favoured-nation tariff relationship between Canada and Sweden. Sweden, in commercial treaties with various countries, has granted conventional rates of duty which, however, have been incorporated into the ordinary tariff and made applicable to all countries.

**Switzerland.**—Under the Treaty of Friendship, Commerce and Reciprocal Establishment between the United Kingdom and Switzerland of Sept. 6, 1855, Canada and Switzerland exchanged most-favoured-nation treatment of each other's goods. Switzerland has reduced some of her rates in treaties, but reductions are incorporated in a single-column tariff that applies to all countries.

**United States.**—A Trade Agreement between Canada and the United States, signed on Nov. 15, 1935, became operative as regards tariff reductions on Jan. 1, 1936 (See p. 496 of the 1938 Year Book).

A more comprehensive Trade Agreement, signed Nov. 17, 1938, grants Canada concessions on 202 items or sub-items of the United States tariff, covering 83 p.c. of Canadian sales (dutiable and free) to the United States for the year 1937. On 107 of these items, representing \$76,577,000 (about half the dutiable imports in 1937) the maximum 50 p.c. reduction in duty was obtained. Of the remaining items 58 are accorded reductions in duty ranging from 10 to 50 p.c., 5 are assured continuance of the existing rate, and 32 continuance of free entry. All concessions of the 1935 Agreement are retained and quotas, where they existed, are either increased or the quota limitation entirely removed. Principal Canadian products benefiting are lumber, shingles, horses, cattle, dairy products, hog products, potatoes, fish, certain grains, hay, poultry, pulp and paper, metals, non-metallic minerals, ferro-alloys, and many lines of manufactured goods. Among the benefits accruing to Canada under the reciprocal most-favoured-nation clause are many reductions in United States duty arising out of a United States-United Kingdom Trade Agreement signed on the same day as the Canadian Agreement. Canada's concessions

to the United States affect 447 tariff items or sub-items, under which imports for the fiscal year 1937 amounted to about 58 p.c. of the total imports from the United States. Reductions in Canadian duty are made on 283 items or sub-items, and duty is fixed at rates hitherto effective on 146. Canada undertook to remove a special excise tax of 3 p.c. then levied on these items. The Agreement contains safe-guarding clauses as to quantitative restrictions, customs valuation, variations in rate of exchange, preventing the principal benefit of a concession going to a third country. The Agreement exchanges unconditional most-favoured-nation treatment with reservation of Canada's Empire preferences and United States preferences granted to Cuba, Philippine Islands, and the Panama Canal Zone. The United States negotiations were, under a tariff amendment Act of June 12, 1934, (Reciprocal Trade Agreements Act) first enacted for three years but extended for another three years by a law of Mar. 1, 1937. The President of the United States formally proclaimed the new Trade Agreement on Nov. 25, 1938. On the day following the President's Proclamation, i.e., Nov. 26, 1938, Article IX of the Agreement became provisionally effective, the result being to exempt Canadian lumber, shingles, and telegraph poles shipped to the United States from the necessity of a mark of origin. Duty concessions, except where otherwise stated, became provisionally effective in both countries on Jan. 1, 1939. The Canadian ratifying Act was assented to in Ottawa by His Majesty the King on May 19, 1939. The Agreement went into force fully on exchange of ratification by the King and a copy of the President's Proclamation on June 17, 1939. It is to be effective for three years from the effective date of Article IX and thereafter, subject to termination on six months' notice by either country.

A Presidential Proclamation of Feb. 27, 1939, allocated to Canada 86.2 p.c. and to other foreign countries 13.8 p.c. of the quota of cattle weighing 700 pounds or more, in consequence of which Canada's quota for the last nine months of 1939 was 142,230 head, and other foreign countries 22,770 head. Quarterly shipments were not to exceed 51,720 head and 8,280 head, respectively. These allocations of cattle weighing 700 pounds or more were renewed on Nov. 30, 1939, for the year 1940, allocating to Canada 193,950 head and to other foreign countries 31,050 head.

A United States-Cuban Trade Agreement brought into force on Dec. 23, 1939, released the United States from obligation to grant Cuban seed potatoes a 50 p.c. preference during December, January, and February of each year, with the result that the tariff reduction on a quota of Canadian seed potatoes was, in accordance with the Canada-United States Trade Agreement, reduced during these months from 60 cents to 37½ cents per 100 lb., the rate already in effect during the other nine months of the year.

A supplementary Trade Agreement, signed on Dec. 30, 1939, reduced United States duty on silver or black fox furs from 37½ to 35 p.c. *ad valorem* and limited total imports into United States of silver and black foxes and their furs to 100,000 units per twelve-month period, beginning Dec. 1, 1939. Canada's share of this quota is 58,300 units per year.

**Uruguay.**—Canada signed a most-favoured-nation Agreement with Uruguay on Aug. 12, 1936, as regards customs duties, quotas, and allocation of exchange for commercial transactions. Notes then exchanged, and renewed from time to time pending the coming into force of the formal agreement, granted the Canadian Inter-

mediate tariff in return for Uruguayan trading facilities for Canadian exports. A Canadian Act ratifying the Agreement was assented to on Apr. 10, 1937. Ratifications were exchanged at Montevideo, Uruguay, on Apr. 15, 1940, bringing the Agreement into force as from May 15, 1940. It is to remain in force for three years and thereafter until terminated on six months' notice. Under the tariff of Uruguay duties may be increased by 50 p.c. on imports from countries that do not offer reciprocity, or do not accord most-favoured-nation treatment to Uruguayan goods.

**Venezuela.**—A Treaty of Amity, Commerce and Navigation between the United Kingdom and Colombia (of which Venezuela was then part) of Apr. 18, 1825, applies to Canada and provides for exchange of most-favoured-nation treatment. The Venezuelan Executive Power is authorized to increase duties up to 100 p.c. on certain goods originating in a specified country, but it has not been learned that this power has been used. A limited number of reduced Venezuelan duties are provided in a Trade Agreement of Aug. 6, 1936, between France and Venezuela and in a Trade Agreement of Nov. 6, 1939, between United States and Venezuela. Otherwise no preferences exist under the Venezuelan Tariff.

**Yugoslavia.**—Article 30 of the United Kingdom-Serb-Croat-Slovene Kingdom Treaty of Commerce and Navigation of May 12, 1927 (affording means for exchange of most-favoured-nation treatment of each other's goods between Canada and Yugoslavia), was accepted by means of the Canadian Trade Agreements Act of June 11, 1928. The Yugoslavian Tariff comprises maximum, minimum, and conventional duties (usually incorporated in the minimum duties).

## Section 2.—The Commercial Intelligence Service.\*

The Commercial Intelligence Service, maintained by the Department of Trade and Commerce, is designed to further the interests of Canadian trade in other parts of the Empire and in foreign countries. To this end there are established throughout the world offices administered by Trade Commissioners. These Trade Commissioners make periodical reports upon trade and financial conditions, variations in markets, and the current demand or opportunities for Canadian products. They also secure and forward to the Department in Ottawa specific inquiries for Canadian goods and, in general, exert their best efforts for the development and expansion of overseas markets.

**Organization at Ottawa.**—Besides the overseas organization of the Commercial Intelligence Service, there is a headquarters staff at Ottawa. This is presided over by a Director, who is the head of the Service and administers and unifies the work assigned to the various Trade Commissioners. Assisting the Director are the following divisions: Directories—where the Exporters Directory, listing Canadian exporters with their agents abroad, commodities handled, ratings, cables and codes used, etc., and the Foreign Importers Directory are kept up to date; Editorial—where the Commercial Intelligence Journal is compiled; Commodity Records—where information regarding markets for Canadian export commodities is indexed; Economics; Animal and Fish Products; Vegetable Products; Metals and Chemical Products; Forest Products; and Manufactured Products. These last five divisions handle correspondence falling within their respective classifications.

\*Revised by L. D. Wilgress, Director, Commercial Intelligence Service, Department of Trade and Commerce.

In order to keep abreast of Canadian industrial development, each Trade Commissioner makes a periodic tour of Canada and, while in this country, gives first-hand information to possible Canadian exporters and makes direct contacts with Canadian manufacturers regarding opportunities and conditions of trade in his territory.

**Organization Abroad.**—A list of the countries in which Canadian Trade Commissioners are located, showing territory covered, name, post office, and cable address of the Trade Commissioner in each case is given below:—

## CANADIAN GOVERNMENT TRADE COMMISSIONERS.

NOTE.—This list was revised as at Jan. 1, 1940. Cable address of Trade Commissioners is "Canadian" unless otherwise stated.

- Argentine Republic*—(Territory includes Uruguay.) J. A. Strong, B. Mitre 430, Buenos Aires (1).
- Australia*—  
 Sydney (territory covers Australian Capital Territory, New South Wales, Queensland, Northern territory and Dependencies.) L. M. Cosgrave. Address for letters—P.O. Box No. 3952V. Office—City Mutual Life Building, Hunter and Bligh Streets.  
 Melbourne (territory covers States of Victoria, South Australia, Western Australia, and Tasmania.) Frederick Palmer, 83 William St., Melbourne, C. 1.
- Belgium and Luxemburg*..... Yves Lamontagne, Shell Building, 60 Ravenstein Street, Brussels.
- Brazil*..... L. S. Glass. Address for letters—Caixa Postal 2164, Rio de Janeiro. Office—Ed. da "A Noite", Sala 802, Praca Maua.
- British India*—(Territory includes Burma and Ceylon.) Paul Sykes. Address for letters—P.O. Box 886 Bombay. Office—Gresham Assurance House, Mint Road, Bombay.
- British Malaya*—(Territory includes the Straits Settlements, the Federated and Unfederated Malay States, British Borneo, Northern Sumatra, Siam [Thailand] and Netherlands Indies.) J. L. Mutter, Union Building, Singapore, Straits Settlements.
- British West Indies*—  
 Trinidad (territory includes Barbados, Windward and Leeward Islands, and British Guiana.) M. B. Palmer. Address for letters—P.O. Box 125, Port of Spain. Office—Barclay's Bank Building.  
 Jamaica (territory covers Jamaica, Haiti, the Bahamas, and British Honduras.) F. W. Fraser, P.O. Box 225. Office—Canadian Bank of Commerce Chambers, Kingston.
- China*—  
 Shanghai (territory includes North and Central China and Manchuria.) V. E. Duclos. P.O. Box 264, Shanghai. Office—Ewo Building, 27 The Bund, Shanghai.
- Cuba*—(Territory includes Dominican Republic and Puerto Rico.) C. S. Bissett. Address for letters—Apartado 1945, Havana. Office address—Royal Bank of Canada Building, Calle Aguiar 367, Havana.
- Egypt*—(Territory includes the Sudan, Palestine, Cyprus, Iraq, Syria, Iran, Greece, Turkey, Bulgaria, and Roumania.) Henri Turcot. Address for letters—P.O. Box 1770, Cairo. Office—22 Shari Kasr el Nil, Cairo.
- France*—(Territory includes French Colonies in North Africa.) Hercule Barré, Commercial Attaché, 3 rue Scribe, Paris (9). Cable address—Cancomac.
- Hong Kong*—(Territory includes South China, the Philippines, and Indo-China.) P. V. McLane. Address for letters—P.O. Box 80, Hong Kong. Office—Hong Kong and Shanghai Bank Building, Hong Kong.
- Ireland and Northern Ireland*..... James Cormack, 66 Upper O'Connell Street, Dublin, Ireland, and 36 Victoria Square, Belfast, Northern Ireland. Cable address—Adanac.
- Italy*—(Territory includes Spain, Portugal, Gibraltar, Malta, Albania, and Yugoslavia.) A. B. Muddiman, Via Manzoni Nr. 5, Milan (102).
- Japan*—  
 Tokyo..... C. M. Croft, Commercial Secretary. Address for letters—P.O. Box 18, Akasaka Post Office, Tokyo. Office—Canadian Legation, 16 Omotecho, 3-chome, Akasakaku, Tokyo.

## CANADIAN GOVERNMENT TRADE COMMISSIONERS—concluded.

- Mexico*—(Territory includes Guatemala, Honduras, and Salvador.)
- Netherlands*—(Territory includes Switzerland.)
- New Zealand*—(Territory includes Fiji and Western Samoa.)
- Norway*—(Territory includes Scandinavian countries and Finland.)
- Panama*—(Territory includes the Canal Zone, Venezuela, Colombia, Nicaragua, and Costa Rica.)
- Peru*—(Territory includes Bolivia, Chile, and Ecuador.)
- South Africa*—  
Cape Town (territory includes Cape Province and Southwest Africa, Natal, Tanganyika, Kenya, Uganda, Mauritius, and Madagascar).  
Johannesburg (territory includes Transvaal, Orange Free State, Bechuanaland, Somaliland, the Rhodesias, Portuguese East Africa, Mozambique, and Nyasaland).
- United Kingdom*—  
London.....  
London (territory covers Home Counties, South-eastern Counties, and East Anglia).  
London (territory—for fresh fruit only—covers United Kingdom, Norway, Denmark, Sweden, France, Holland, Belgium, and Germany).  
London.....  
Liverpool (territory covers North of England, Lincolnshire, North Midlands, and North Wales).  
Bristol (territory covers West of England, South Wales, and South Midlands).  
Glasgow.....
- United States*—  
Chicago (territory covers the Middle States of the United States).  
Los Angeles (territory covers the Mid-Western and Western States of the United States).  
New York City (territory includes Bermuda).
- R. T. Young. Address for letters—Apartado Num. 126-bis, Mexico City. Office—Edificio Banco de Londres y Mexico, Num. 30, Mexico City. Cable address—Cancoma.
- James Langley, Coolsingel 111b, Rotterdam.
- W. F. Bull. Address for letters—P.O. Box 33, Auckland. Office—Yorkshire House, Shortland Street, Auckland.
- Richard Grew. Address for letters—Stortingsgaten 28, Oslo.
- H. W. Brighton. Address for letters—P.O. Box 222, Panama City. Office—98 Central Avenue, Panama City.
- M. J. Vechslor. Address for letters—Casilla 1212, Lima. Office—Edificio Boza Carabaya 831, Plaza, San Martin, Lima.
- J. C. Macgillivray. Address for letters—P.O. Box 683, Cape Town. Office—New South African Mutual Buildings, 17 Parliament Street, Cape Town. Cable address—Cantracom.
- J. H. English. Address for letters—P.O. Box 715. Office—Prudential Assurance Building, 92 Fox St., Johannesburg. Cable address—Cantracom.
- Frederic Hudd, Chief Trade Commissioner in the United Kingdom, Canada House, Trafalgar Square, S.W. 1. Cable address—Sleighbing, London.
- G. R. Heasman, Canada House, Trafalgar Square, S.W. 1.
- W. B. Gornall, Fruit Trade Commissioner, Aldine House, Bedford Street, Strand, W.C. 2. Cable address—Canfrucum.
- G. R. Paterson, Animal Products Trade Commissioner, Canada House, Trafalgar Square, S.W. 1. Cable address—Agrilson.
- A. E. Bryan, Martins Bank Building, Water Street, Liverpool.
- E. L. McColl, Northcliffe House, Colston Ave., Bristol.
- G. B. Johnson, 200 St. Vincent Street, Glasgow. Cable address—Cantracom.
- W. J. Riddiford, Tribune Tower Building, 435 North Michigan Avenue, Chicago.
- B. C. Butler, Associated Realty Building, 510 West Sixth Street, Los Angeles.
- D. S. Cole, British Empire Building, Rockefeller Centre, New York City. Cable address—Cantracom.

Under an arrangement made by the Minister of Trade and Commerce with the British Foreign Office, Canadian manufacturers, exporters, and others interested in trade matters may secure information and advice from British commercial diplomatic officers and British consuls in all countries in which Canada is not represented by her own Commercial Intelligence Service.

**Commercial Intelligence Journal.**—The Commercial Intelligence Journal, containing the reports of the Trade Commissioners and other pertinent material relating to export trade, is published weekly by the Department of Trade and Commerce in both English and French editions. The subscription price for either edition is \$1 per annum in Canada and \$3.50 outside of the Dominion. Special reports dealing with various phases of Canada's export trade are also issued from time to time, as supplements to the Commercial Intelligence Journal.

### Section 3.—Statistics of External Trade.\*

External trade statistics are derived by recording the physical movement of goods outwards or inwards across the frontiers or through ocean ports and the valuations placed upon them at the time of movement. Such statistics cannot take cognizance of the complex financial transactions involved in this physical movement of goods, which transactions may take place prior to or subsequent to the actual shipment (although in investigating the balance of international payments, as in Sect. 5 of this chapter, such financial transactions are the sole consideration). Certain problems of procedure arise in recording trade statistics and it is necessary to explain these. Such problems may be conveniently classified as those relating generally to recording the movements of goods and those relating to the movements of gold.

**General Explanations regarding Trade Statistics.**—For the correct interpretation of the statistics of external trade, it is necessary that the following definitions and explanations of terms used, as well as certain features of the statistics that necessitate adjustments to the external trade figures, be carefully kept in mind, if the true position of trade in relation to the total of Canada's international transactions is to be understood.

**Fiscal Years.**—The Canadian fiscal year ended on June 30 of the years from 1868 to 1906, and on Mar. 31 of 1907 and subsequent years.

**Quantities and Values.**—In all tables of imports and exports, the quantities and values are based upon the declarations of importers (import entries) and exporters (export entries), as subsequently checked by customs officials.

**Imports: Valuation.**—"Imports" means imports entered for consumption. "Entered for consumption" does not necessarily imply that the goods have been actually consumed in Canada, but that they have passed into the possession of the importer and that duty has been paid on that portion liable for duty.

Under the main provisions of the law, the value of merchandise imported into Canada is the fair market value or price thereof when sold for home consumption in the principal markets of the country from which, and at the same time when, said merchandise was exported directly to Canada; but the value shall not be less than the price to jobbers and wholesalers generally, nor less than the actual cost of production at the time of shipment plus a reasonable advance for cost of selling and profit. (See Sects. 35 to 45 of the Customs Act.) Under these provisions and amendments thereto, some imports are given arbitrary valuations differing from those upon which actual payments for the imports are made.

For Customs entry purposes, the value of the currency of the country of export is converted to Canadian currency at exchange ratios as authorized by law and Orders in Council. (See Sect. 55 of the Customs Act and Orders in Council respecting currency valuations.) Differences arising from fluctuations in the exchange rates of foreign currencies are treated more fully below under the heading "Discrepancies in Trade Statistics between Canada and Other Countries".

\*Revised by A. L. Neal, B.A., B.Sc. (Econ.), Chief, External Trade Branch, Dominion Bureau of Statistics. This Branch publishes the Annual Report on the Trade of Canada, the Condensed Preliminary Report on the Trade of Canada (annual), the Quarterly Report on the Trade of Canada, the Calendar Year Report on the Trade of Canada, the Summary of the Trade of Canada (monthly), etc. For complete list of the publications of this Branch, see Chapter XXIX, Sect. 1, under "External Trade".

*Canadian Exports: Valuation.*—"Canadian produce" exported includes Canadian products or manufactures, also exports of commodities of foreign origin which have been changed in form or enhanced in value by further manufacture in Canada, such as sugar refined in Canada from imported raw sugar, aluminium extracted from imported ore, and articles constructed or manufactured from imported materials. The value of exports of Canadian merchandise is the actual cost or the value at the time of exportation at the points in Canada whence consigned for export.

*Foreign Exports: Valuation.*—"Foreign produce" exported consists of foreign merchandise that had previously been imported (entered for home consumption). The value of such commodities is the actual cost.

*Countries to Which Trade is Credited.*—Imports are classified as received from the countries whence they were consigned to Canada. The countries of consignment are the countries from which the goods have come, without interruption of transit, save in the course of transshipment or transfer from one conveyance to another. The countries whence goods are consigned are not necessarily the countries of actual origin, since goods produced in one country may be purchased by a firm in another country and thence dispatched, after a longer or shorter interval, to Canada. In such cases the second country would be the country of consignment, to which the goods would be credited. An example is the case of tea grown in the Orient but purchased in the bonded market in London, England; Canadian statistics record such imports as coming from the United Kingdom.

Exports are credited to the country of final destination, i.e., the country to which they are consigned, whether that country possesses a seaboard or not. The country of final destination is the country to which goods exported from Canada are intended to pass, without interruption of transit save in the course of transshipment or transfer from one means of conveyance to another.

*Discrepancies in Trade Statistics between Canada and Other Countries.*—Canadian statistics of exports are rarely in exact agreement with the import figures of her customers and similar differences occur with Canadian imports. Many factors contribute to these discrepancies; among these are the following:—

1. Differences in the basis of the Canadian valuations and those of the valuations of other countries.

The recent period of disturbed currency relations between countries has introduced an additional element of difference in valuations. Thus imports from the United Kingdom have been valued all along at \$4·86½ to the £, although for two years after Sept. 21 1931, the actual value of the £ was below that figure, dropping as low as \$3·70, and the actual value of imports from the United Kingdom was thereby greatly exaggerated. More recently, when the exchange value of the £ was above par, imports from the United Kingdom were undervalued. Similar difficulties have resulted from disturbances in exchange levels with other countries, and the placing of arbitrary valuations upon their currencies, as in the case of imports from Japan.

A further discrepancy in valuation of imports from the United Kingdom existed from 1920 to Mar. 31, 1935, in connection with distilled spirits, an important item in imports from that country. The valuation of Canadian imports of spirits from the United Kingdom included, during this period, the excise duty in addition to the British export valuation, an excess valuation aggregating over \$200,000,000 for the period 1920-34. The excise duty has been excluded from the valuation of such imports since Apr. 1, 1935.

2. Even where the statistics cover the same period of time, there are quantities of goods on their way from the exporting to the importing country at the beginning and end of the period.

3. By far the greatest discrepancies occur from the impossibility of determining the country of final destination for exports or the actual country of origin for imports. A considerable proportion of Canada's exports to overseas countries (8.4 p.c. in 1939) is shipped via the United States. Some of this is credited by importing countries to the United States. Canadian grain exports, for example, are frequently routed through the United States in bond. Most of this grain leaves Canada with the United Kingdom as the stated destination, but large quantities are later diverted to other European or overseas countries and some is taken out of bond for consumption in the United States. Thus the Canadian record of exports to the United Kingdom may be \$100,000,000 or more in excess of Canadian products actually received by the United Kingdom, while stated exports to other overseas countries are short this amount. Again, United States grain is routed through Canada and shipped from Montreal and is therefore frequently shown by other countries as imported from Canada, while it is included in United States statistics as an export to Canada. As mentioned above, purchases in bonded markets in England, Germany, Belgium, and France are included in Canadian imports from those countries but are not included by those countries in exports to Canada.

For more detailed discussion of this subject see the article and tables on "Discrepancies in Trade Statistics" on pp. 778-781 of the Annual Report on the Trade of Canada, 1928, and pp. 21-29 of the Condensed Preliminary Report on the Trade of Canada, 1939, both published by the Dominion Bureau of Statistics.

**Treatment of Gold in Trade Statistics.**—Exports of gold in Canadian trade statistics are distinguished as between monetary and non-monetary. Monetary gold exports are those that entail a corresponding reduction in the Dominion's monetary gold stocks. All other gold exports (classed as non-monetary) are shown as merchandise and included with total merchandise exports in trade statistics. This procedure was determined, following the Conference of British Commonwealth Statisticians in 1935, by the Dominion Bureau of Statistics in conference with the Bank of Canada and the Department of National Revenue. In former times there was a movement of gold from Canada in the form of "gold-bearing quartz, dust, nuggets, and gold bullion obtained direct from mining operations". When the Royal Mint in Ottawa began to refine gold, exports formerly shipped as "gold-bearing quartz, dust, etc." began to be exported in the form of bullion and were recorded under "coin and bullion" as distinct from "merchandise". In order to maintain comparability with the statistics of previous years it was considered expedient to adopt the present procedure. It was also felt that since gold, like other great export staples, is a product of Canadian resources and industry and, in large part, is exported independently of domestic monetary considerations, it ought not to be excluded from the statistics of exports, and should not be classed as 'money' when it bears no relation to the Canadian monetary system. The change was inaugurated on Apr. 1, 1936, and appropriate revisions made in the trade statistics for previous years back to 1926. Prior to this time no substantial revision was necessary. When the change was made it was considered that there would be no re-exports of non-monetary gold, i.e., exports (non-monetary in character) of

previously imported gold; therefore no provision was made for this distinction with respect to exports of foreign products. However, it was found, as will be indicated below, that in order to represent faithfully the facts of the case the distinction was necessary for foreign exports as well as domestic exports and, accordingly, that has been done since Apr. 1, 1938. Since June 1, 1931, gold exports have been valued at the monthly average current market price.

Certain difficulties, however, arise when gold is included with ordinary commercial commodities.

The fact that gold is a money metal gives it peculiar attributes that distinguish it from other commodities. In particular, the movement of gold in international trade is determined almost exclusively by monetary factors. The amount of exports may fluctuate widely from month to month owing to other than ordinary trade or commercial considerations. The nationality of gold does not affect its value as an export asset and, therefore, domestic and foreign gold are mutually substitutable. It is doubtless correct to treat new gold based on current production as a commodity of mineral origin and so classify it in export statistics, but it may happen that foreign (i.e., previously imported) gold may be exported without reducing monetary stocks. At certain times recently, substantial amounts of foreign gold coin have been exported owing to the premium obtainable on coined gold. Exports of domestic bullion were correspondingly smaller, since it was substituted for the foreign gold in stocks held in Canada. Furthermore, gold does not move in international trade in any direct or normal relation to sales and purchases. It may be sold abroad without moving out across the frontier. Trade statistics deal only with physical movements, sales or purchases of gold which do not involve an actual movement being more properly taken care of in the "International Balance of Payments" statements dealt with in Sect. 5 of this chapter. Domestic gold added to earmark stock, although sold abroad, does not appear in export statistics because it remains in Canada. In view, however, of the relation to external trade, statistics respecting holdings of earmarked gold are now appended in the Bureau of Statistics trade reports with an explanatory footnote (see also p. 585).

To comprehend in its entirety, therefore, the effect of gold movements upon the figures of the export trade of Canada, it is necessary to consider non-monetary exports of domestic gold and of foreign gold, as well as earmarkings by the Bank of Canada. Admittedly, the statistics in this connection are somewhat complicated, but they represent complicated facts. However, it is very necessary that the effects of fluctuations in the movement of gold should be borne in mind in dealing with statistics of trade. Gold may now form a very large item in the value of annual exports (Canada's production in 1939 is estimated as worth over \$181,000,000) so that fluctuations in the movement may materially affect the apparent value and distribution of Canada's trade. For instance, in one year the major part of the gold may be shipped to London, in another year to New York, or it may be accumulated under earmark, resulting in wide variation in the value and proportion of exports to the United Kingdom and the United States. So far exports have been confined almost entirely to these two countries. It may sometimes be desirable to view movements of trade in strictly commercial commodities alone. In order to facilitate doing so, a statement of non-monetary gold exports is given below, which will enable the student to make the desired adjustments to the trade statistics given in the main body of this chapter.

**Subsection 1.—Value and Quantum of World Trade.\***

World imports and exports, on which the figures in Statement V, pp. 507-508, are based, are the sum of the recorded imports and exports of individual countries reduced to the common monetary unit of United States old gold dollars (i.e., of gold valued at \$20.67 per fine ounce). On this basis, the value of world trade fell off by nearly 13 p.c. in 1938 compared with 1937. The average prices in gold for goods entering into world trade fell by 5 p.c. and the quantum of trade fell by about 8 p.c., being about 11 p.c. below that of 1929. The quantum of trade declined annually from 1929 to 1932 when it had reached a level of about 25 p.c. below that of 1929. After 1932, quantum increased each year until 1937 and dropped again in 1938. Average gold prices of goods comprising world trade had been declining since 1925, the annual declines being comparatively small until the end of 1929, but became quite precipitous to 1932 and then tapered off to 1935, in which year they were only 42.5 p.c. of their level in 1929 or about 41 p.c. of that of 1927. The trend of gold prices turned upward in 1936 and the first half of 1937, but declined again in the second half of 1937, the year's average being 48.0 p.c. For 1938 the average was 45.5 p.c. Signs of an improvement in trade occurred in the middle of the year, the downward trend of the first half being arrested in the second half, while a normal seasonal expansion in quantum is noticeable for the last quarter.

Recent changes in world trading conditions appear to have been determined chiefly by the variations in the United States demand for goods, raw materials in particular, that resulted from the sharp changes in her industrial activity in 1937 and 1938. In the latest year, United States imports were over a third lower than in 1927, but her exports declined at a lower rate than those of her chief competitors. Japan also suffered a severe set-back in her trade with countries outside the 'yen bloc', while Germany increased both the quantum and the value of her imports in 1938, in spite of a decline in her competitive power in export markets. The increased demand for materials for armament purposes and for machinery and other capital equipment from non-industrialized countries were off-setting factors that appear to have abated the aggravation of trading conditions that began in 1937. The non-industrial countries as a general rule maintained their imports at a high level despite the reduced demand for most of their products and the deterioration in

\*Abbreviated from "Review of World Trade, 1938", published by the League of Nations.

their terms of trade. Both exports and imports of the United Kingdom fell by 11 p.c. in gold value, the decline in exports being due to a reduction in quantum and that in imports to lower prices. The decline of about one-fifth in the exchange value of the franc somewhat obscured the trade situation of France, but there was an apparent increase in the quantum of exports, confined, in the main, to such highly manufactured goods as textiles, while imports fell off in quantity.

Later monthly reports of the League of Nations indicate that prices were down slightly in the first half of 1939 while quantum, after declining in the first quarter, showed a sharp increase in the second quarter.

**Trade by Groups of Commodities.**—The commodities that enter into world trade may be roughly divided into three groups, namely, foodstuffs, raw materials, and manufactured goods.

The estimated movement since 1929 of the proportion of total trade, average gold prices, and quantum of commodities belonging to the three groups is shown in Statement II below. The estimates are based on information concerning five\* principal trading countries representing about 41 p.c. of world trade.

## II.—PRICE AND QUANTUM MOVEMENTS OF GROUPS OF COMMODITIES IN WORLD TRADE, 1929 AND 1932-38.

(1929=100.)

<sup>1</sup>Revised since the publication of the 1939 Year Book. \*

The improvement, developing since 1932 in the barter terms of trade of agricultural and mineral-producing countries, continued in 1938, although the terms of trade of these countries had deteriorated so rapidly during the early years of the depression that they still remained lower than in the years 1925-29. Such countries reached their most advantageous position since 1929 in the first half of 1937. Declining prices of primary commodities caused a deterioration in their barter terms again toward the end of the year and throughout 1938.

\*United Kingdom, United States, Germany, France, and Italy.

**Trade in Certain Staple Products.**—A study of the trade in the major staple products throws some light upon certain of the tendencies that have recently affected the international exchange of goods.

Of important food staples, coffee registered an increase in the quantity entering into world trade in 1938, maize and sugar showed decreases, and wheat, butter, and cheese were on practically the same level as in 1937. The decrease in the supply of wheat from the Argentine and certain Danubian countries was offset by larger sales from the United States, Canada, and Australia. Imports into European countries were somewhat lower, and into other countries somewhat higher, than in 1937. During the latter half of 1938, however, European imports, in spite of abundant crops in several importing countries, rose to a higher level than in the corresponding period of 1937. This increase is explained by the fall in price, the building-up of emergency reserves by some countries and the subsidizing of exports by the United States. The fall in the price of wheat also contributed to the reduction in the amount of maize entering world markets, but the major cause was the great reduction in the size of the crop in Argentina. The increase in the quantity of coffee marketed was due to the fall in prices consequent upon the breakdown of the Brazilian coffee valorization.

The decrease in quantum as well as in the price of raw materials was generally greater than in the case of foodstuffs. Trade in cotton was lower, owing to decreased demand from the United Kingdom and Japan, while an increase of 18 p.c. in the world crop kept prices low. Exports of wool were higher, owing to increased demand from the United Kingdom, Germany, and France. Decreased production of rubber was attended by an increased demand, with a consequent lowering of stocks and an increase in prices. The estimated absorption of rubber during the second half of the year was 14 p.c. over the first half. Trade in coal and coke was depressed, but coal prices were higher. Imports of mineral oils into six leading importing countries registered increases of 6·8 p.c. and 8·3 p.c. for crude and refined oils, respectively. While complete statistics regarding the amount of copper entering into world trade are lacking, there was an apparent increase in quantum due to larger imports by Germany. Tin prices fell up to the end of May, but rose by about a third during the remainder of the year; the quantum was lower, owing to further restrictions upon output. Imports into the United States and the United Kingdom were lower by 44·4 p.c. and 47·6 p.c., respectively, while those into Germany increased by 20·0 p.c.

**Geographic Distribution of World Trade.**—In Statement III, showing the percentage distribution of world trade by continents for the period 1929-38, the figures for each continental group are the sums of those of the individual countries comprising such group and therefore include trade between the members of the group. The United Kingdom and the United States have been separated from the remainder of their respective continental groups because trade tendencies in these two principal trading countries show movements differing from those of the remainder of their continental groups. Thus, while the total trade of the United Kingdom has become an increased percentage of total world trade, that of the remainder of Europe has become considerably less, although an improvement was noted in 1938. The trade of the United States has declined materially as a percentage of world trade, but that of the remainder of North America (chiefly Canada), after declining during the depression, was about the same percentage in 1936 as in 1929. In the two latest years, however, there has been a recession to a point lower than the 1929 figure.

The outstanding change in world imports was the decline in the share of North America from 16·1 p.c. in 1929 to 13·9 p.c. in 1937 and 10·9 p.c. in 1938. The

decline in 1938 was due chiefly to the setback of United States production and the resulting fall in United States imports, particularly of raw materials. All other continental groups increased their shares in world imports.

The share of North America in world exports increased, however, in 1938, although still lower than the 1929 position. The United States alone was responsible for this increase, mainly a result of greater exports of cereals. Europe also increased its share of exports, Oceania showed approximately the same percentage as in 1937, while Latin America, Africa, and Asia showed smaller proportions.

<sup>1</sup>Revised since the publication of the 1939 Year Book.

Intra-Commonwealth trade was estimated at 25·7 p.c. of the total trade of the British Commonwealth in 1929 and 1931, 29·1 p.c. in 1932, 30·6 p.c. in 1936, and 31·4 p.c. in 1937. The rise from 1932 to 1938 in the share of the British Commonwealth in world trade contrasts sharply with the fall in that of the French Empire.

**Factors Influencing World Trade.**—In addition to the considerations of price and industrial and trade conditions, there are other factors that are exerting a strong influence on world trade. While space does not permit an exhaustive analysis of the circumstances that have determined the changes taking place, certain of the chief factors may be mentioned.

*Effects of War Apprehensions.*—The uncertainties of the international situation had a very depressing effect on trading conditions as between nations during the year 1938. This is not so much a result of the continuance of the 'undeclared wars' in China and Spain as of the danger—almost expectancy—of more extensive conflicts. All the nations whose foreign communications were vulnerable had taken the precaution to increase their stocks of foreign raw materials and foodstuffs and trade in armaments was very active with consequent demand for commodities directly concerned.

United Kingdom imports of whale oil, for example, increased in quantity by 50 p.c. (from 152,000 long tons in 1937 to 226,000 in 1938) and her imports of aluminium and nickel were twice as high in 1938 as they were in 1936. There was a tenfold increase in German cereal imports in 1937 and 1938 and a heavy rise in the last-mentioned year in German purchases of certain metals and mineral oils. The same is true of Japanese trade and indeed of that of several other countries.

In 1938 the stimulating influence of the threat of war on trade was obvious, and its importance was enhanced by the fact that the purchases for armament purposes gathered pace just at a period—from the middle of 1937 to the middle of 1938—when the decline in the United States demand for goods threatened to initiate a world-wide depression similar to that which began in 1929. The depression that actually occurred was serious enough to cause a considerable fall in the prices of primary products.

However, there are in most countries rather narrow limits to the increase in imports for armaments. A heavy increase in purchases of foreign goods for such purposes is likely in most countries to lead sooner or later to a decline in the imports of other goods, or in exports, or both. Thus, the chief reasons for the collapse, in 1938, of Japanese trade with countries outside the 'yen bloc' appear to have been the scarcity of raw materials for the export industry—aggravated by the exchange control introduced as one of the means of putting Japanese economy on a war basis, increased manufacturing costs within Japan, and consequent inability to pursue the policy of selling at low prices that had previously been Japan's strongest weapon in her competition in foreign markets. As a result, a substantial part of Japan's markets was won by competitors. Germany's sale of coal, coke, iron, and crude iron products fell off sharply while imports of iron ore and mineral ores showed a big increase. In spite of increased value of imports in 1938, certain civil industries in Germany suffered from an acute shortage of raw materials, resulting in an adverse influence upon exports.

The stimulating influence of increased armaments upon trade is likely to be limited, therefore, but in the latter part of 1937 and in 1938, when there was a rapid expansion of purchases for armament purposes, at the same time as the relatively low industrial activity in the United States was exercising a deflationary

influence, the stimulating effect seems to have preponderated. But even to the extent that armament policies have not directly affected the terms of trade between industrial and non-industrial countries, it has probably contributed to the maintenance of a higher business activity within countries, in general, and has indirectly stimulated international trade.

*Formation of Economic Groups of Countries.*—The disintegration of world trade through the formation of economic groups reflects the measures of trade and currency control through which countries have endeavoured to avert the effect of the disturbances in their international account that became manifest during the early part of the trade depression. There has been a relative increase in trade between certain big industrial countries and such raw-material-producing countries as are bound to them by political ties or are otherwise dominated by their influence. In the first instance, trade has increased between mother countries and their dominions, colonies, and protectorates. But the relative increase in trade within these groups has been brought about not only by discriminatory measures but largely by the fact that the countries of each group have the same currency, or currencies, which have been linked to each other. The importance of monetary stability may be illustrated by the fact that, besides the British Commonwealth, other countries which are generally classed as belonging to the 'sterling bloc' have also increased their share in the trade of the United Kingdom.

As an illustration of the changes in trade that this procedure brought about, the trading percentages for the years 1929, 1935, and 1938 show the current trend. Imports of the United Kingdom from countries comprising her Empire were 30.2 p.c. of the total in 1929, 39 p.c. in 1935, and 41.9 p.c. in 1938. Similarly, imports from countries of the sterling bloc increased slightly from 12 p.c. in 1929 to 12.5 p.c. in 1935, and 12.8 p.c. in 1938. In 1929, 44.4 p.c. of exports from the United Kingdom went to Empire countries as compared with 47.6 p.c. in 1935, and 49.9 p.c. in 1938. Exports to countries of the sterling bloc made up 7.4 p.c. of total exports in 1929, 11.5 p.c. in 1935, and 11.7 p.c. in 1938.

The redistribution of trade is illustrated even more strikingly in the case of Japan. Between 1935 and 1938, the share in Japan's exports of countries falling within her special sphere of influence rose from 41 p.c. to 63 p.c. In the same period German exports to southeastern Europe and Latin America rose from 17 p.c. to 25 p.c. of the total.

The disorganization of the system of multilateral trade has led to difficulties in financing imports of primary products required by industrial countries. The non-industrial countries within the respective "empires" are indebted to their mother countries and normally have to meet the payments due by the aid of an excess of exports over imports. The production of these countries is highly specialized and their exports—and accordingly their surplus of exports—have a natural tendency to spread over a wide range of industrial countries besides those to which the debts are due. The transfer of the debt payment is rendered possible by an excess of exports of these raw-material-producing countries, either in their trade with the respective creditor countries or with countries that in their turn have an excess of exports to the creditor countries. Practically all important trading countries, irrespective of their political and geographical situation, are involved in this system of triangular and multilateral trade.

In 1938, the decline in the imports of several creditor countries, the deterioration in the terms of trade of agricultural countries and the resulting prominence given to

the transfer problem gave new impetus to the tendencies of disintegration of world trade. In the shelter of the new trade and currency regulations there has grown up a range of vested interests which, together with considerations of a political nature, block the way to the restoration of a "world" market.

Commercial agreements, particularly between the United States and Canada and the United Kingdom tend to counteract the tendencies described above. In view of the volume of trade they regulate, these agreements will do a great deal towards the abolition of trade discriminations.

**Canada's Position in World Trade.**—The foregoing brief outline of the course of world trade in the period since 1929, taken from the League of Nations reports, is presented as a background against which Canada's position in world trade may be viewed. According to these figures, Canada, in 1938, stood eighth in imports, fourth in exports, and fifth in total trade, whereas in 1929 she was fifth in each category. In total trade, Canada gained fifth place from Japan whose share, in world imports particularly, declined considerably. The positions of the leading countries are shown in the first section of Statement V.

The second section of Statement V shows the indexes of gold prices and quantum of trade for each of these countries. The index of gold prices is significant as an indication of changes in the barter terms of trade.

Some of the factors that especially affected Canada's trade in 1938 deserve mention. Exports of "Agricultural and Vegetable Products" registered increases in quantity but were seriously affected by price declines. The metal groups were favoured with higher prices but the increases were not sufficient to overcome the declines in volume.

V.—PERCENTAGES, PRICES, AND QUANTUM OF TRADE OF TWENTY-TWO LEADING COUNTRIES OF THE WORLD, 1929, 1932, 1937, AND 1938.

NOTE.—Basis: Recorded values of merchandise trade converted to U.S.A. old gold dollars. Price indexes are on the basis of old gold dollars. The year 1927 is taken as the base for both price and quantum indexes.

## Subsection 2.—Historical Statistics of Canadian Trade.

The most important features of Canadian trade are reviewed historically (since Confederation in most cases) in the first nine main tables of this chapter (pp. 526-533).

A general view of the trade of Canada in the fiscal years from 1868 to 1939 is furnished in Table 1 (p. 526), giving the imports of merchandise for home consumption, dutiable and free, and the exports of Canadian and foreign produce, the total trade as here given being the aggregate of the two. Necessarily, some difficulties have been met in maintaining comparable statistics through such a length of time, one of the most serious of these arising from the different methods adopted in dealing with exports of foreign produce. For example, the shrinkage in the exports of foreign produce since 1920 has been due to change of statistical method rather than to actual diminution in value or volume of such goods exported. For the past 19 years, re-exports of foreign products from bonded warehouses have not been included in Canadian trade statistics either as imports or as exports; exports of foreign produce during this period have been composed of goods previously entered as imports for home consumption. Such goods are debited to Canada when entering this country, and should be credited to Canada when re-exported.

From Table 2 it will be observed that, in most of the years from Confederation to the outbreak of the War of 1914-18, imports entered for consumption exceeded total exports, especially during the great growing period from 1904 to 1914. Since that

time, however, there has been an annual excess of exports except in the fiscal years ended 1921, 1930, and 1931, when there were heavy return movements of funds to Canada in the form of an excess of imports.

The values of coin and bullion imported and exported are shown in Table 3 (p. 528). Exports of non-monetary gold bullion are not included in this table (see pp. 499-500).

The figures of Tables 5 and 6 (pp. 530-531) show the overwhelming predominance of the two English-speaking countries in Canada's foreign trade; in the year ended Mar. 31, 1939, for example, 75.7 p.c. of the Dominion's exports of domestic produce was shipped to these two countries, which, in the same year, together provided 80.3 p.c. of Canada's imports for home consumption. Tables 7 and 8 show, respectively, by years, the percentage proportions of imports from the United Kingdom and the United States to totals of dutiable and free imports since 1911, and the *ad valorem* rates of duty collected on imports from these and from all countries from 1868 to 1939. The apparently higher average rate collected on imports from the United Kingdom than on those from the United States, in spite of the preferential tariff accorded British goods since 1897, is explained briefly on p. 512 and in more detail at pp. 58-59 of the "Condensed Preliminary Report on the Trade of Canada, 1936", and at pp. 509-510 of the 1937 Year Book.

### Subsection 3.—General Analysis of Current Import and Export Trade.

The figures of Statement VI, p. 510, indicate the seriousness of the decline in trade during the depression shown by the figures for the fiscal year 1933, and the extent of the recovery since then. That the decline in the quantum or volume of trade was not so great as that of the values here shown is evident from the analyses in Subsections 1 and 10 of this chapter. The recovery from the low point of the depression has been greater in exports than in imports. Imports are an indication of purchasing power and are especially influenced by the expansion or contraction of capital expenditures within Canada. In the past, years of population growth and rapid expansion in the productive equipment of Canada have been associated with greatly increased imports, since such imports of goods provide the means by which external capital is brought into the country. Conditions for such capital imports on a large scale do not exist at present, while Canada's productive facilities provide a large volume of exports, the surplus of which represents in large measure retirements of foreign indebtedness (see Sect. 5 of this chapter, pp. 584-589).

Current trends in external trade are determined largely by conditions and policies throughout the world that influence the geographical distribution of trade, and by changes regarding the supply of, and demand for, commodities of trade in which Canada is interested. These factors are discussed as completely as space permits in Subsections 1, 6, and 7 of this Section.

The figures of exports shown in Statement VI indicate that a shift is taking place in the importance of groups in the composition of our exports. In the prosperity period, 1925-29, Canadian exports were predominantly agricultural. Indeed, in that period it was largely because bountiful harvests coincided with an active world demand at good prices that prosperity was widespread in Canada. In 1927 the two groups, vegetable and animal products, made up 59 p.c. of exports, while non-ferrous metals constituted only 6.4 p.c. In 1939, on the other hand, vegetable and animal products made up only 33 p.c. of exports, but non-ferrous metals (including gold) increased to over 29 p.c. In this connection see the text regarding principal commodities exported on pp. 520-521.

**Statistical Tables of Current Trade.**—Tables 10 to 18 (pp. 534-575) deal with the current trade statistics of the Dominion. Tables 10 and 11 are summary tables, showing by groups Canada's trade with the United Kingdom, the United States, and all countries, by values and percentages, for the latest four fiscal years. Table 12 shows the same in detail for exports and Table 13 for imports of all important commodities. Table 14 shows, by main classes, imports as dutiable or free and exports as of Canadian or foreign produce for the five fiscal years 1935-39. Table 15 shows imports and exports for the fiscal year ended 1939 by degree of manufacture and by origin, and Table 16 gives similar information on a classification according to purpose.

In past years, Table 17 showed imports and exports for the two latest years by ports and provinces. The value of imports and exports at the several ports of entry were not a criterion of total imports for consumption at such ports nor all exports that originated there. The figures were therefore misleading unless these

limitations were understood and even then their value in summary form was slight. For this reason, the table has been discontinued this year. A full treatment of the subject is given in the annual report on the Trade of Canada issued by the Dominion Bureau of Statistics. Table 17 in this issue therefore corresponds to Table 18 of previous editions and shows the values imported from different countries dutiable or free under the general, preferential, and treaty tariffs in 1939.

#### Subsection 4.—Trade with the United Kingdom and the British Empire.

**Trade with the United Kingdom.**—Ever since Confederation the external trade of Canada has been carried on predominantly with one or other of the two great English-speaking countries, the United Kingdom and the United States (see Tables 5 and 6 of this chapter). In the early years of the Dominion, the United Kingdom, which was then lending Canada capital on a considerable scale for those times, supplied more than half her imports, though as a customer she came second to the United States. The export trade continued for some time to follow its accustomed channels to the United States, in spite of the denunciation of the Reciprocity Treaty that had expired on Mar. 17, 1866. However, partly as a result of the free trade policy of the United Kingdom and the protectionist policy of the United States, the proportion of exports tended to increase to the United Kingdom and decrease to the United States. In the '70's this proportion to the latter country, which had been over 50 p.c. in the first few years of Confederation, declined materially, but for the most part remained at over 40 p.c. until after the enactment of the McKinley Tariff of 1890 when it fell to 35 p.c. in 1892, and as low as 27 p.c. in 1898. The United Kingdom, although it had been the chief market for Canadian exports in certain years between 1874 and 1887, definitely took the lead in 1890 and steadily retained that position until 1920. During the War of 1914-18 the flow of goods from Canada to the United Kingdom was naturally exceptionally large. However, the United States again became the chief market in 1921 and has maintained that position continuously since 1927, except in the fiscal year 1934, when exports to the United States dropped to 34 p.c. of the total, partly because of the diversion of exports of gold to London during that year (see pp. 500-501), and also to the industrial depression in the United States.

As already indicated, at the time of Confederation, the United Kingdom was the principal source of Canadian imports and until 1875 that country supplied half or more of the requirements. The United States took the lead in 1876 and has maintained it since 1883. Imports from that country have exceeded half the total from 1877 to 1879 and continuously since 1896, the proximity of the two countries, the increasing population on both sides of the boundary line, the common language, and the similarity of tastes and economic conditions being largely responsible. The proportion of imports coming from the United Kingdom has shown a generally declining trend since 1872, although after the enactment of the British Preference in 1897 the actual values of imports from the United Kingdom grew larger until the first World War. (See under the Preferential Tariff and Empire Trade below.) Even during the great growing period before 1914, when large amounts of British capital were being invested in Canada, the proportion of imports from the United Kingdom tended to decline while that from the United States increased. During the War of 1914-18, when the resources of the United Kingdom were absorbed in the struggle, imports from that source were curtailed and dropped as low as 8.0 p.c. in the fiscal year 1919, while imports from the United States rose to about 82 p.c. of the

total at that time. Since then, the proportion of imports from the United Kingdom has been generally a trifle lower and that from the United States higher than in the period before 1914, although during the depression, under the influence of the Ottawa Agreements and the suspension of imports of capital goods from the United States, the trend was reversed, apparently temporarily.

Statement VI, p. 510, shows Canada's trade with the United Kingdom in two recent years compared with that in 1933, 1927, and 1914. It may be noted that in the latest years there has been a very great decline in imports of textiles, partially compensated by some increase in imports of iron, non-metallic mineral, and chemical products. Vegetable and animal products continue to make up the major part of exports to the United Kingdom, but there has been an actual and a great proportional increase in exports of wood and paper products and non-ferrous metals.

The commodities making up Canada's export and import trade with the United Kingdom in recent years are dealt with in summary form in Tables 10 and 11, and in detail in Tables 12 and 13 of this chapter.

**The Preferential Tariff and Empire Trade.**—Canada was the first of the British Dominions to grant a preference on goods the produce and manufacture of the United Kingdom and reciprocating British Dominions and possessions. This preference was extended from time to time to other portions of the British Empire until now it is applicable to practically every British Dominion and possession. In the case of Newfoundland, in addition to the preference, Canada grants free admission to fish and fish products. The British West Indies receives special concessions under the Agreement of 1925 referred to on p. 487.

The British preferential tariff enacted in 1897 has had the effect of stimulating Canada's Empire trade. When the British preference became effective in 1897, Canada's total imports from the United Kingdom amounted to only \$29,401,000, compared with imports in 1887 valued at \$44,741,000 and in 1873 at \$67,997,000, so that from 1873 to 1897 imports from the United Kingdom declined by \$38,596,000 or 56·7 p.c. After the introduction of the British preferential tariff, the downward trend in the value of imports from the United Kingdom was reversed, although the proportion of total imports coming from the United Kingdom continued to decline. Imports from other Empire countries, which were insignificant before the beginning of the century, have increased both in actual value and proportion of total imports.

*Average Rates of Duty under the British Preference.*—Table 17 on p. 573 shows for the latest fiscal year the imports from countries of the British Empire entering Canada either at lower rates of duty or free under the preferential tariff, while Table 8, on p. 532, shows the average *ad valorem* rates of duty on imports from the United Kingdom, United States, and all countries in each year since Confederation. The apparently higher average rate collected on imports from the United Kingdom than on those from the United States, in spite of the preferential tariff accorded British goods since 1897, is due largely to the following factors: (1) imports of alcoholic beverages, which are subject to high duties, bulk largely in imports from the United Kingdom but are negligible from the United States; (2) imports of raw materials for processing in Canada, which are free of duty, form an important part of imports from the United States; and (3) dutiable imports from the United Kingdom are largely highly manufactured goods which are subject to relatively higher rates than the semi-manufactured goods for further manufacture in Canada that form another large element of imports from the United States. To make a fair comparison between the United Kingdom and the United States of the average

rates of duty collected on ordinary dutiable imports, imports of alcoholic beverages and manufactured tobaccos should be eliminated, while imports free of duty under the British preference but dutiable when imported from the United States should be added to the dutiable imports from the United Kingdom. After these logical adjustments the average rate of duty on imports from the United Kingdom has been lower in each year since 1922, while the difference in favour of the United Kingdom has become 50 p.c. or more in recent years. This subject is treated in more detail at pp. 58-59 of the "Condensed Preliminary Report on the Trade of Canada, 1936," and at pp. 509-510 of the 1937 Year Book.

**Trade with the British Empire.**—This is marked by a much larger proportion of exports than of imports. The percentage of both import and export trade with the Empire, other than the United Kingdom, has shown a generally upward trend in the period covered since 1886. The industrial organization of Canada draws increasing imports of raw materials from other Empire countries, which in turn provide an expanding market for her manufactured and specialized products.

For the intelligent interpretation of trends in trade over a long period such as is covered in Statement VII, it is essential to bear in mind the effects of shifts in the production of commodities and in world demand, as well as fluctuations in price levels and in business cycles. These factors are discussed at pp. 516-522 in connection with the principal commodities imported and exported and in connection with world trade at pp. 501-508.

<sup>1</sup> Revised since the publication of the 1939 Year Book.

**Subsection 5.—Trade with United States and Other Foreign Countries.\***

For convenience of comparison and to avoid repetition, the relative importance of the United Kingdom and the United States in the trade of Canada is discussed in connection with the United Kingdom under Subsection 4, p. 511. A record of the value and proportion of trade with the United States in each year since 1868 is given in Tables 5 and 6 of this chapter, pp. 530 and 531.

The commodities of Canadian export and import trade with the United States are shown in summary form in Tables 10 and 11 and in detail in Tables 12 and 13 of this chapter.

Trade with the United States by main groups of commodities for two recent fiscal years compared with 1933, 1927, and 1914 is shown in Statement VI, p. 510. Non-metallic minerals (chiefly coal and petroleum products) and chemicals are an increasingly important factor in imports from the United States, although iron products again became the most important group in 1935 and there are still large imports of textiles, which include raw cotton, and of vegetable products largely comprised of tropical or out-of-season fruits and vegetables. Aside from the effects of the Ottawa Agreements, with their purpose of increasing intra-Empire trade, and of the at-times heavy discount against Canadian funds in the United States, a factor in the fluctuation of the United States share in imports into Canada that should not be overlooked is the influence of capital expenditures here. The United States is the principal external source for machinery, equipment, and structural materials. The almost complete cessation of capital expenditures in the depression, therefore, affected imports from the United States more than from any other country, while recovery tended to cause them to rise more rapidly again.

Another important factor influencing imports from the United States is Canadian purchasing power which is very directly affected by exports to the United States. These latter were seriously curtailed by the very high rates on important Canadian products introduced by the Hawley-Smoot Tariff of June, 1930, and thereafter imports from the United States showed a greater decline than Canadian exports to that country. (See the 1936 Year Book, p. 508.)

However, this situation has been relieved by the trade agreements. The influence of the economic recovery in both Canada and the United States should not be overlooked as a factor in the recent increases of trade, while shipments of gold to the United States have augmented exports to that country.

**Canadian Trade via the United States.**—Imports from overseas countries via the United States have steadily declined in recent years, especially those from the British Empire. This decrease has followed: (1) general propaganda to utilize Canadian sea and river ports; (2) additional concessions to goods imported under the preferential tariff if they come direct. Provision has been made, in trade treaties and agreements negotiated with foreign countries, that goods must be imported via a Canadian sea or river port in order to obtain the full benefits of special rates of duty. Between 1920 and 1939 imports via the United States have decreased from 9.5 p.c. to 1.9 p.c. of the total imports from overseas countries.

The proportion of exports from Canada to overseas countries going via the United States has shown a considerable decline since 1927, the percentages by fiscal

\*Tables 14 to 45 (pp. 93-133) of the "Condensed Preliminary Report on the Trade of Canada, 1939", published by the Dominion Bureau of Statistics, show the trade of Canada in leading commodities with 96 British and foreign countries for the fiscal years 1937 and 1938.

years being: 1927, 39.4; 1928, 38.7; 1929, 36.6; 1930, 33.7; 1931, 27.3; 1932, 18.7; 1933, 14.2; 1934, 14.4; 1935, 17.3; 1936, 18.4; 1937, 16.5; 1938, 11.4, and 1939, 8.4. An important factor in the decline for recent years was the requirement of direct shipment for goods to qualify under the Empire preferences introduced in Britain, but this factor was cancelled, so far as wheat is concerned, under the United Kingdom-United States Trade Agreement which came into effect Jan. 1, 1939. Details of exports via the United States by countries are given in Table 20 of this chapter.

**Trade with Other Foreign Countries.**—The positions occupied by the United States and other foreign countries in Canada's trade in various years from 1886 to 1939 are shown in Statement VIII below. During the War of 1914-18 and the years immediately following, when production and exports by many European countries were curtailed, imports from the United States rose to a high proportion, while those from other foreign countries declined. With this exception, the proportion of imports from other foreign countries has remained surprisingly constant, at about one-tenth to one-eighth of total imports, over the period of nearly half a century. Canadian exports to other foreign countries increased from 4.5 p.c. to 24.0 p.c. in 1929 but they have since declined.

<sup>1</sup> Revised since the publication of the 1939 Year Book. Changes do not affect percentages.

### Subsection 6.—Geographical Distribution of Canadian Trade by Continents and Countries.

**Canadian Trade by Continents.**—A summary of the imports and exports of Canada by continents for representative fiscal years since 1929 is given in Statement IX, below. The part of the table showing percentages is of particular interest as indicating trends in the distribution of trade. In connection with these trends, the influences affecting the geographical distribution of world trade as outlined on pp. 503-505 should be considered. The fiscal year 1929 was the peak year before the depression while 1933 was the lowest year. In the declining phase of the depression the percentage of imports from the United Kingdom and "Other Europe" tended to increase while that from the United States fell off very considerably. In the recovery phase since 1933 the percentage of imports from the United States has risen again, while that from "Other Europe" has declined to a much lower figure than formerly. Compared with 1929, much larger proportions of imports are now coming from Asia, Oceania, and Africa, due to increased direct imports of industrial raw materials from these continents. The restrictive measures regarding trade adopted by many European countries have greatly reduced the share of "Other Europe" in the exports of Canada while the market for Canadian goods in Oceania and Africa has expanded.

<sup>1</sup>Revised since the publication of the 1939 Year Book.

**Imports from Principal Countries.**—Statement X, which follows, shows how predominant are the two great English-speaking countries as sources of supply of Canadian imports. Trade with these two leading countries is more fully covered

in Subsections 4 and 5 of this Section. The percentage of imports from countries from which Canada obtains important industrial materials is tending to rise with the progress of recovery in Canada. Imports from France have been seriously affected in recent years by the unfavourable economic conditions prevailing in that country, while Germany's restrictive policy regarding trade is resulting in a declining trend in imports from that country. In Table 18 of this chapter will be found the values of imports from all important countries in recent years.

X.—PERCENTAGES OF TOTAL IMPORTS INTO CANADA FROM EACH OF TWELVE LEADING COUNTRIES, FISCAL YEARS 1936-39.

NOTE.—Countries arranged in order of importance, 1939.

Rank in—				Country.	Percentages of Total Imports.				P.C. Increases or Decreases in 1939 Compared with—		
1936	1937	1938	1939		1936.	1937.	1938.	1939.	1936.	1937.	1938.

Percentages of Total Imports Coming from Above 12 Countries.....					88.5	88.7	89.7	91.7	-	-	-

**Exports to Principal Countries.**—Percentages in Statement XI, as in the import statement, are indicative of the predominance of the United Kingdom and the United States as customers of Canada. Similarity of tastes and standards of living, as well as favourable tariff arrangements, are important factors in expanding exports of Canadian products to the other British dominions. Table 19 of this chapter gives actual values of Canadian exports to all important British and foreign countries for the latest five fiscal years.

XI.—PERCENTAGES OF TOTAL DOMESTIC EXPORTS FROM CANADA TO EACH OF TWELVE LEADING COUNTRIES, FISCAL YEARS 1936-39.

NOTE.—Countries arranged in order of importance 1939.

Rank in—				Country.	Percentages of Domestic Exports.				P.C. Increases or Decreases in 1939 Compared with—		
1936	1937	1938	1939		1936.	1937.	1938.	1939.	1936.	1937.	1938.

Percentages of Total Domestic Exports Going to Above 12 Countries.....					92.9	93.0	92.3	91.8	-	-	-

### Subsection 7.—Principal Commodities Imported and Exported.

The commodities that make up Canada's external trade are shown in detail for the four latest fiscal years in Tables 12, dealing with exports, and 13, with imports, beginning on p. 536 and p. 548, respectively.

**Canada's Principal Imports.**—In the interpretation of the trends in imports, shown in Statement XII, the effects of price changes and of fluctuations of the so-called business cycle should be kept in mind. Thus the Bureau of Statistics index number of wholesale prices on the 1926 base was 59.3 in the calendar year 1889, 52.1 in 1899, 59.5 in 1909, 134.0 in 1919, 95.6 in 1929, and 78.6 in 1938; these calendar years approximate to the fiscal years ended 1890, 1900, 1910, 1920, 1930, and 1939. In the matter of business fluctuations, the fiscal years 1890 and 1900 were affected by the long period of depressed commercial conditions accompanying declining price trends extending from 1872 to 1897; the fiscal year 1910 was influenced by the general development boom in Western Canada; 1920 was affected by the feverish activity that immediately followed the War of 1914-18; 1930 represented the end of the security inflation period and the beginning of the downturn; while in 1939, recovery, as compared with the low figures of 1933, was under way to a marked degree, both in general activity and in the level of wholesale prices.
